---

# Abstract

The Silent Inspector (SI) application allows near-real time dredging data to be viewed alongside geospatial information stored in an enterprise geodatabase. Using this technology, the US Army Corps of Engineers can monitor the ocean dumping activities of our dredge operators, run initial quality control queries, and produce reports to inform the Environmental Protection Agency (EPA) of dredge disposal activities.

## Accessing the Map

- Using your web browser, go to <http://opjdev/>. The screen below appears. This application currently resides on a develop server in the Spatial Data Branch and accessible only through the intranet.

Future deployment will be accessed from <http://gis.sam.usace.army.mil>.

- Click "Map Room".
- Select "SI Ocean Disposal GIS Basemap" from the drop-down list.
- Click "Open Map" link.

## Accessing the Application

1. Click “SI Monitor” button.

This will open a search form. This form allows a user to search for SI data by District, Date, Vessel, and Contract #.

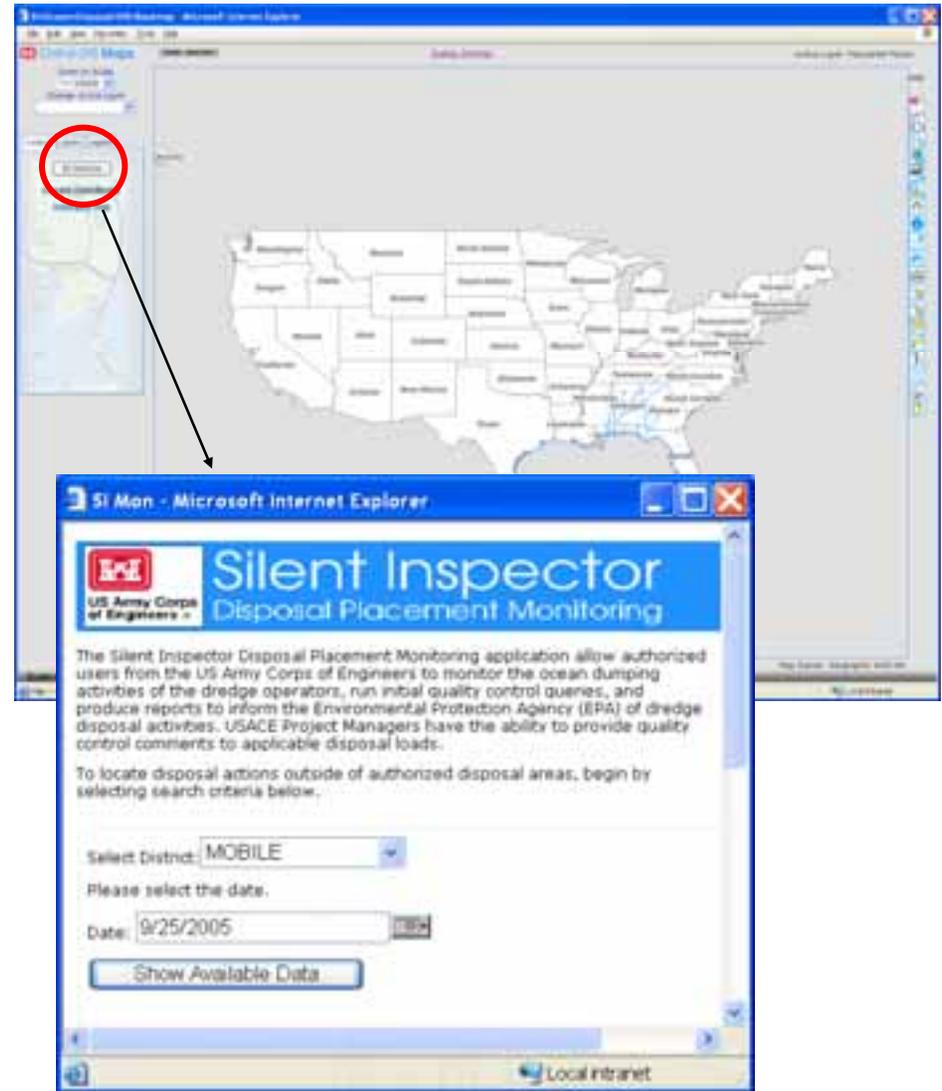

2. Select the district and a date for the search.

The district dropdown box is filled by querying a database in Vicksburg, MS.

3. Click “Show Available Data” button.

When the “Show Available Data” button is selected, the SI database is queried based on the user input. Disposal events that occurred on the selected date for the selected district, will be available for selection in the next step.

If no data exist for the selection, the most recent dredge date for the selected district will be displayed for the user.

## Selection The Load

4. Select the desired Vessel/Contract/Load# from the drop-down list.

The “Vessel/Contract/Load# /ALL” can be selected if no particular Load number is desired.

5. Click “Select Disposal Sites” button.

When this button is selected, a request is sent to IMS using .Net Link.

The “Disposal Sites” layer is spatially queried to determine which disposal sites exist based on the user-supplied inputs.

## Using .NET Link to Query the Feature Class in IMS

Imports ESRI                      &    Reference    ESRI.ArcIMS.Server

---

'Get the disposal names from the disposal feature class in the IMS service

Dim sAXL As String

Dim axlResponse As New System.Xml.XmlDocument

sAXL = "<?xml version=""1.0"" encoding=""UTF-8""?>"

sAXL = "<ARXML version=""1.1"">"

sAXL &= "<REQUEST><GET\_FEATURES envelope=""false"" beginrecord=""0"" geometry=""false""  
outputmode=""xml"" compact=""false"" >"

sAXL &= "<LAYER id="" & strLayerID & "" />"

sAXL &= "<SPATIALQUERY subfields=""#SHAPE# FEAT\_NAME"" where=""DIST\_NAME="" & strDisName &  
""""></SPATIALQUERY>"

sAXL &= "</GET\_FEATURES>"

sAXL &= "</REQUEST></ARXML>"

Dim nameConn As New ESRI.arcims.server.ServerConnection("opjdev", 5300)

nameConn.ServiceName = "D000"

axlResponse.LoadXml(CleanXMLResponse(nameConn.Send(sAXL, "Query")))

' Get and display all the disposal site names.

Dim root As System.Xml.XmlElement = axlResponse.DocumentElement

Dim nodeList As System.Xml.XmlNodeList = root.GetElementsByTagName("FIELDS")

## Using .Net Link to Fill the Array

```
Dim i, n, m, HoldIndex As Integer  
Dim strName, temp As String  
Dim arrName As New ArrayList  
Dim index As Integer
```

```
'Fills an array with the disposal names as they are in the feature class
```

```
For i = 0 To nodeList.Count - 1
```

```
    strName =  
    nodeList.Item(i).Attributes("GCWGS84_VECTOR.GCWGS84.placement_area.FEAT_NAME").InnerXml.ToString  
    arrName.Add(strName)
```

```
Next i
```

## Selection the Disposal Area

6. Select the authorized disposal site from the drop-down list.

The names of the disposal sites, are extracted from the attribute in the disposal area feature class.

7. Click the “Track Plots” button to plot the points where the loads were dumped.

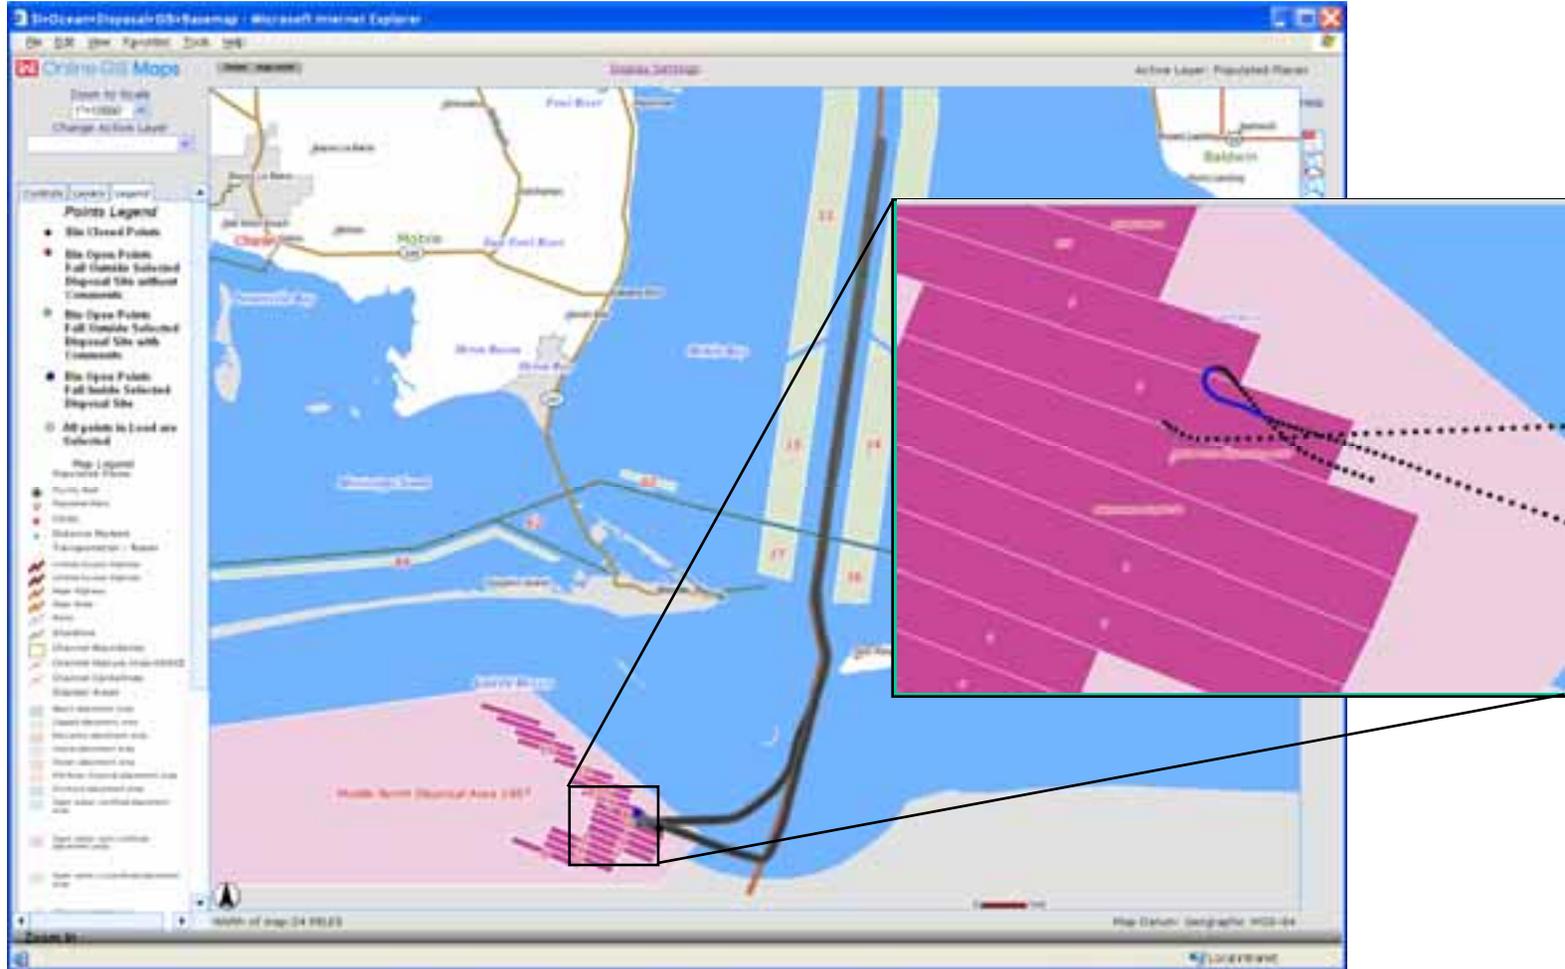

When the “Track Plots” button is selected, the SI database is queried once again to acquire the XY location of the vessel. These points are filtered by the user-defined queried and are plotted on the map.

8. Click the “Zoom to Bin Open” button to zoom to the open points outside the selected disposal site. This will zoom the user into the location on the map.

The points are drawn using the acetate layer for IMS. The user is not able to use the identify tool to retrieve information. This drawback was solved by displaying the information in a form.

## Plot Results

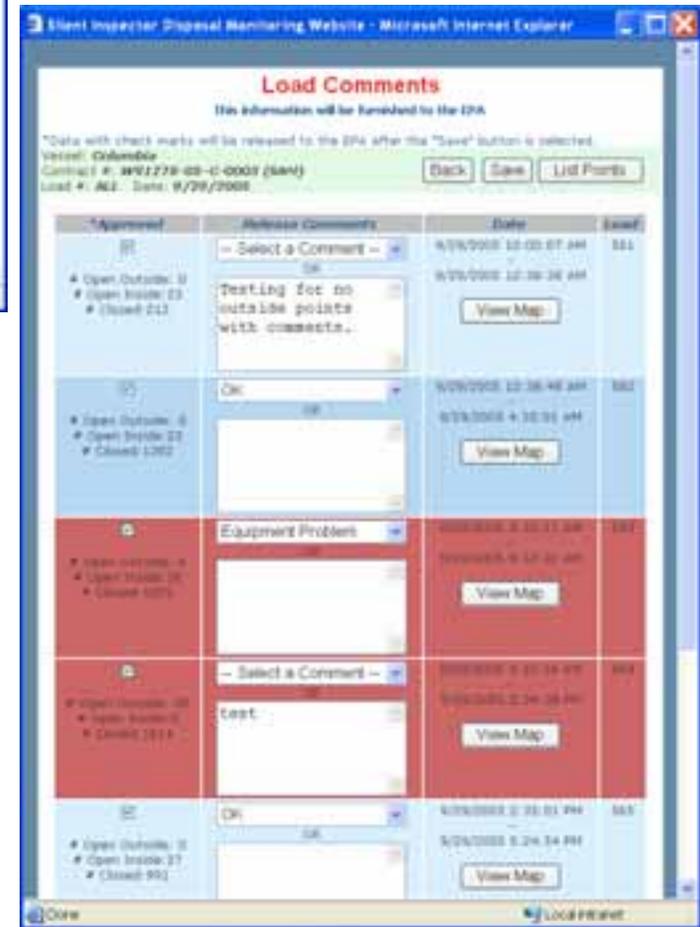

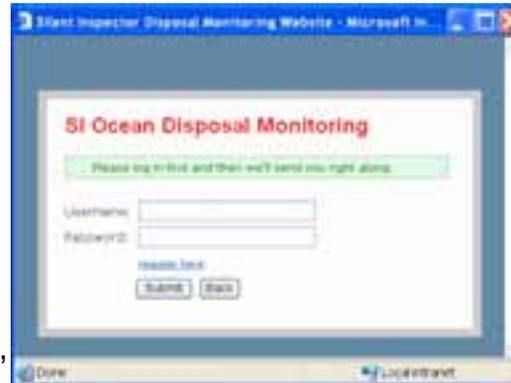

*"Track Plot" Zooms To All Plotted Points*

## Authorized User Access

9. Once the authorized user is able to view the vessel points on the map, authorized users can log in to the site. The points are grouped by "Load" numbers.
10. All loads with open points falling outside the disposal site are shaded red.
11. By default, the "Release Comments" for all loads that have no open points outside are set to "OK". Once the user selects the release type
12. Clicking on the "View Map" button takes the users to the selected group of point and puts a green circle around it. The user can click the "List Points" button to view a list of all points. All points for the selected load are yellow.
13. Once all necessary changes are made, the user clicks the "Save" button to save the changes to the database. A report of the results is sent to the EPA.

These following placement locations have been identified as falling inside / outside the disposal area.  
 Vessel: *Columbia* Contract #: *W91278-05-C-0003 (SAM)*  
 Dates: *9/29/2005-10/2/2005*
