# Crystal structures and hydrogen bonding in the isotopic series of hydrated alkali metal (K, Rb and Cs) complexes with 4-aminophenylarsonic acid

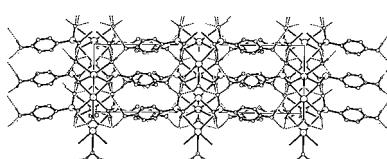

Graham Smith<sup>a\*</sup> and Urs D. Wermuth<sup>b</sup>

<sup>a</sup>Science and Engineering Faculty, Queensland University of Technology, GPO Box 2434, Brisbane, Queensland 4001, Australia, and <sup>b</sup>School of Natural Sciences, Griffith University, Nathan, Queensland 4111, Australia. \*Correspondence e-mail: gsmith@bigpond.com

The structures of the alkali metal (K, Rb and Cs) complex salts with 4-aminophenylarsonic acid (*p*-arsanilic acid) manifest an isotopic series with the general formula  $[M_2(C_6H_7AsNO_3)_2(H_2O)_3]$ , with  $M = K$  {poly[di- $\mu_3$ -4-aminophenylarsonato-tri- $\mu_2$ -aqua-dipotassium],  $[K_2(C_6H_7AsNO_3)_2(H_2O)_3]$ , (I)}, Rb {poly[di- $\mu_3$ -4-aminophenylarsonato-tri- $\mu_2$ -aqua-dirubidium],  $[Rb_2(C_6H_7AsNO_3)_2(H_2O)_3]$ , (II)}, and Cs {poly[di- $\mu_3$ -4-aminophenylarsonato-tri- $\mu_2$ -aqua-dirubidium],  $[Cs_2(C_6H_7AsNO_3)_2(H_2O)_3]$ , (III)}, in which the repeating structural units lie across crystallographic mirror planes containing two independent and different metal cations and a bridging water molecule, with the two hydrogen *p*-arsanilate ligands and the second water molecule lying outside the mirror plane. The bonding about the two metal cations in all complexes is similar, one five-coordinate, the other progressing from five-coordinate in (I) to eight-coordinate in both (II) and (III), with overall  $M-O$  bond-length ranges of 2.694 (5)–3.009 (7) Å (K), 2.818 (4)–3.246 (4) Å (Rb) and 2.961 (9)–3.400 (10) Å (Cs). The additional three bonds in (II) and (III) are the result of inter-metal bridging through the water ligands. Two-dimensional coordination polymeric structures with the layers lying parallel to (100) are generated through a number of bridging bonds involving the water molecules (including hydrogen-bonding interactions), as well as through the arsanilate O atoms. These layers are linked across [100] through amine N–H···O hydrogen bonds to arsonate and water O-atom acceptors, giving overall three-dimensional network structures.

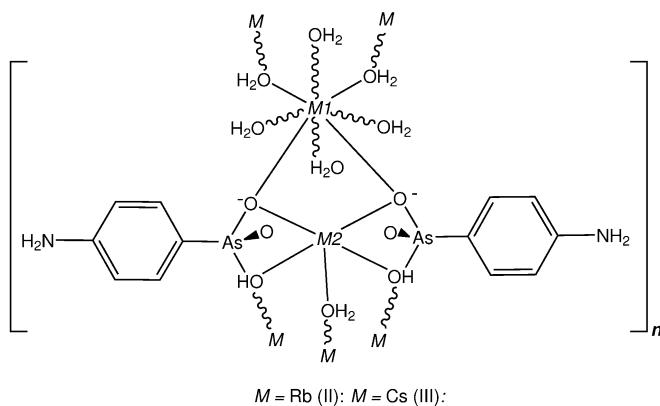

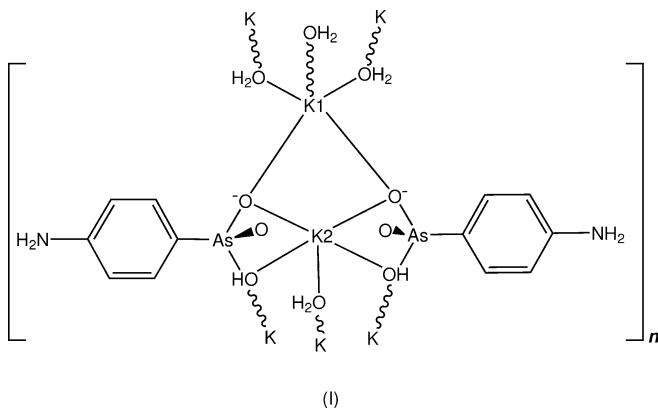

## 1. Chemical context

Arsenical 4-aminophenylarsonic acid (*p*-arsanilic acid) has biological significance as an anti-helminth in veterinary applications (Steverding, 2010; O'Neil, 2001) and as a hydrated sodium salt (atoxyl) that had early usage as an anti-syphilitic (Ehrlich & Bertheim, 1907; Bosch & Rosich, 2008). The crystal structure of this salt has been determined together with the  $NH_4^+$  salt (Smith & Wermuth, 2014); the structure of the parent *p*-arsanilic acid, which exists as a zwitterion, is also known (Shimada, 1961; Nuttall & Hunter, 1996). We have also determined the structures of the alkaline earth metal (Mg, Ca, Sr, Ba) salts of the acid (Smith & Wermuth, 2017). However, simple *p*-arsanilate single-metal complex structures are not common in the Cambridge Structure Database (Groom *et al.*, 2016), examples being with  $Ag^I$  (three forms), Zn, Pb and Cd (Lesikar-Parrish *et al.*, 2013; Xiao *et al.*, 2015); Zn (Lin *et al.*, 2012); Cd (Liu *et al.*, 2010);  $Sn^{IV}$  (Xie *et al.*, 2008);  $V^{IV}$  and  $V^V$  (Breen *et al.*, 2012; Chen *et al.*, 2012; Khan *et al.*, 1992);  $UO_2$  (Adelani *et al.*, 2012). Mixed-metal and/or mixed-ligand complexes are common, e.g.  $Co^{II}/Mo=O$ ,  $Ni^{II}/Mo=O$ ,  $Cu^{II}/$

OPEN  ACCESS

$\text{Mo}=\text{O}$  and  $\text{Zn}/\text{Mo}=\text{O}$  with *p*-arsanilate and ligands such as 2,2'-bipyridine, 4,4'-bipyridine and 1,10-phenanthroline (Smith *et al.*, 2013).

In an attempt to complete the structures of the alkali metal series of *p*-arsanilate salts, our reaction of the acid with potassium carbonate, rubidium carbonate and caesium carbonate in ethanol/water resulted in the formation of the crystalline hydrated salts with general formula  $[M^+{}_2(\text{C}_6\text{H}_7\text{AsNO}_3)^-{}_2 \cdot 3\text{H}_2\text{O}]$ . Compounds (I) ( $M = \text{K}$ ), (II) ( $\text{Rb}$ ) and (III) ( $\text{Cs}$ ) and their crystal structures are reported herein. However, suitable crystals of the Li analogue were not obtained to allow its crystal structure determination.

## 2. Structural commentary

The structures of the three title compounds [(I), (II) and (III)] form an isotopic series, with the asymmetric units in each comprising two independent and different metal complex cations ( $M1$  and  $M2$ ), which lie on crystallographic mirror planes that also contain one of the coordinating water molecules ( $\text{O}2\text{W}$ ), with the hydrogen *p*-arsanilate ligands and the second water molecules ( $\text{OW1}$ ,  $\text{O1W}^{ii}$ ) [symmetry code: (ii)  $-x + 1, -y, z$ ] lying across the mirror plane (Figs. 1, 2 and 3, respectively). In all three examples, the  $M2$  cation is five-coordinate, while with  $M1$ , the coordination spheres progress from five-coordinate in (I) to eight-coordinate in (II) and (III). The overall  $M-\text{O}$  bond length ranges are 2.694 (5)–3.009 (7) Å (K) (Table 1), 2.818 (4)–3.246 (4) Å (Rb) (Table 2) and 2.961 (9)–3.400 (10) Å (Cs) (Table 2). The amine N atom

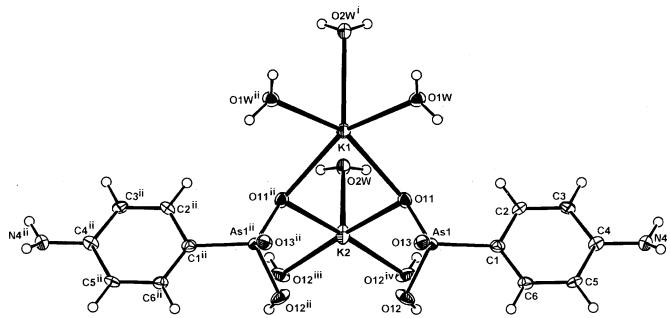

Figure 1

The molecular configuration and atom numbering scheme for the complex unit in (I). The metal cations ( $K1$  and  $K2$ ) and the water molecule ( $O2W$ ) lie on a mirror plane with mirror-related atoms indicated by symmetry code (ii)  $-x + 1, -y, z + \frac{1}{2}$ . For other codes, see Table 1. Non-H atoms are shown as displacement ellipsoids at the 40% probability level.

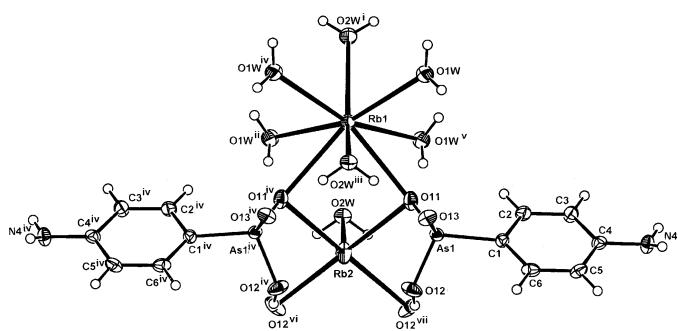

Figure 2

The molecular configuration and atom numbering scheme for the complex unit in the isotopic structure (II). The metal cations ( $Rb1$  and  $Rb2$ ) and the water molecule ( $O2W$ ) also lie on a mirror plane. For symmetry codes, see Table 2. Non-H atoms are shown as displacement ellipsoids at the 40% probability level.

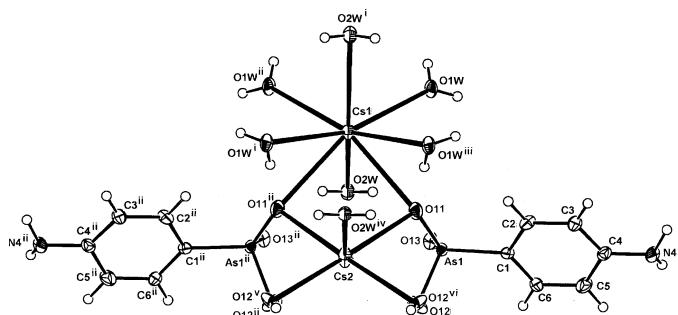

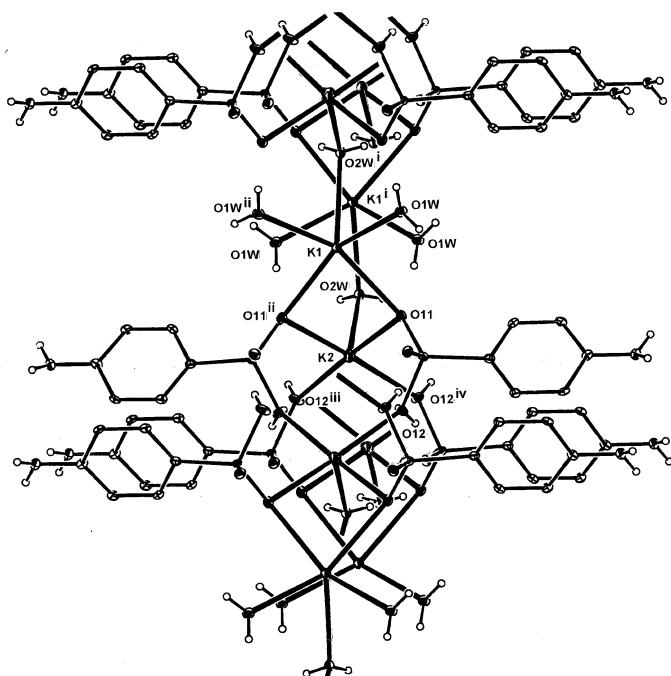

Figure 3

The molecular configuration and atom numbering scheme for the complex unit in the isotopic structure (III). The metal cations ( $Cs1$  and  $Cs2$ ) and the water molecule ( $O2W$ ) also lie on a mirror plane. For symmetry codes, see Table 3. Non-H atoms are shown as displacement ellipsoids at the 40% probability level.

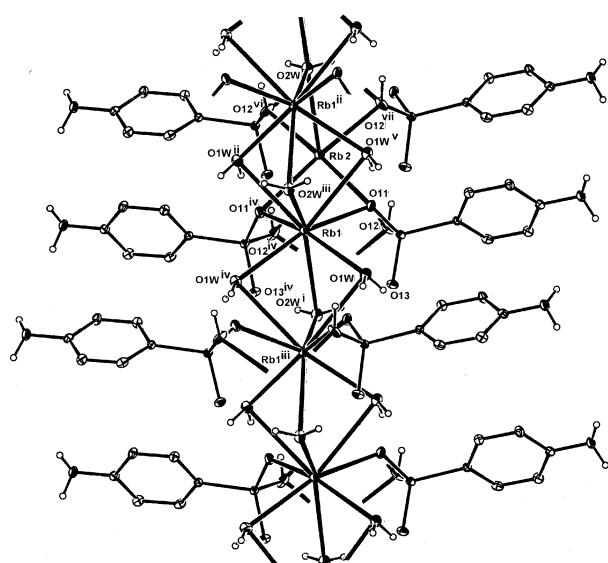

is not involved in bonding to the metal, as is the case in a number of other *p*-arsanilate complexes, *e.g.* with Zn (Lin *et al.*, 2012). The  $M1\text{O}_5$  polyhedra in all three structures comprise four bridging arsonate O atoms and the  $\mu_2$  bridging water molecule ( $O2W$ ) (Tables 1, 2 and 3). The second  $M2\text{O}_5$  polyhedron in (I) comprises the bridging  $\text{O}11$  and  $\text{O}11^{ii}$

**Figure 4**

donors, the  $\mu_2\text{-O}2\text{W}^{\text{i}}$  [symmetry code: (i)  $-x + 1, -y + 2, z + \frac{1}{2}$ ] donor and two monodentate water molecules ( $\text{O}1\text{W}$  and  $\text{O}1\text{W}^{\text{i}}$ ) (Table 1).

With (II) and (III), the irregular  $M2\text{O}_8$  coordination sphere comprises all bonds mentioned in the description of the K complex (I), and in addition, the Rb and Cs bond length expansion allows further coordination sites through additional

bridging bonds to both of the water molecules (two through  $\text{O}1\text{W}$  and one through  $\text{O}2\text{W}$ ), (Tables 2 and 3). The  $M1\cdots M2$  separations are 4.139 (3) Å [for (I)], 4.2500 (11) Å [for (II)] and 4.3498 (15) Å [for (III)]. There are also slightly shorter  $M1\cdots M1^i$  separations in all structures: 4.079 (3) Å (I), 4.1953 (13) Å (II) and 4.3127 (16) Å (III). Relatively short  $M2\cdots As1$  separations are present within the repeat unit in all three structures: 3.6369 (19) Å (I), 3.7796 (8) Å (II) and 3.9488 (14) Å (III).

In all structures, two-dimensional coordination polymeric complex structures are generated, with the layers lying in the mirror planes parallel to (100). Fig. 4 shows the basic makeup of the layer in (I) while those for (II) or (III) are shown in Fig. 5. The water molecule  $\text{O}2\text{W}$  provides hydrogen-bonding links across the mirror plane to arsonate  $\text{O}13$  acceptors (Tables 4, 5 and 6).

### 3. Supramolecular features

In the crystals of all three compounds, similar overall packing modes are observed, with the coordination polymeric layers lying along the mirror planes inter-linked across [100] through amine  $\text{N}4-\text{H}\cdots\text{O}$  hydrogen bonds to arsonate  $\text{O}13$  and water  $\text{O}1\text{W}$  acceptors (Tables 4, 5 and 6). In this respect, they resemble the crystal packing of the Na *p*-arsanilate analogue (Smith & Wermuth, 2014) but the structure of that compound

(a trihydrate) differs from the current isotopic set in having significantly different coordination spheres, also lacking the mirror symmetry of the primary polymeric layers in (I)–(III). With these, the N4 amino group acts as an acceptor to an O1W hydrogen bond. The water molecule O1W also forms a

hydrogen bond with O11<sup>vi</sup> [symmetry code: (vi)  $x, -y + 2, z + \frac{1}{2}$ ] in (I), but not in (II) or (III). The protonated *p*-arsanilate O atom (O12) forms an intra-layer hydrogen bond with an O11 acceptor, giving overall three-dimensional network structures in all cases (Figs. 6 and 7). No  $\pi$ – $\pi$  associations are present in the structures.

#### 4. Database survey

Three-dimensional supramolecular structures involving complexes of hydrogen *p*-arsanilate and mixed metal types, as distinct from those involving uni-metal types, such as in (I)–(III) and in those examples which have been previously mentioned in the *Chemical context* section of this article, are worthy of noting here. Mixed-metal-ligand examples (Smith *et al.*, 2013) as well as mixed-metal structures add to the complexity of the coordination polymeric structures commonly generated, *e.g.* in the Mo/Ag, Mo/Cu and W/Na polyoxometallate compounds (Johnson *et al.*, 2002), the Mo/V cage structure (Onet *et al.*, 2011) or the V/Na structure (Breen & Schmitt, 2008).

**Figure 6**

## 5. Synthesis and crystallization

Compounds (I)–(III) were synthesized by heating together for 5 min, 1 mmol quantities of 4-aminophenylarsonic acid and 0.5 mmol of either  $K_2CO_3$  [for (I)],  $Rb_2CO_3$  [for (II)] or  $Cs_2CO_3$  [for (III)], in 20 ml of 50% ethanol/water (v/v). Room temperature evaporation of the solutions gave colourless crystal plates of the title compounds from which specimens were cleaved for the X-ray analyses.

## 6. Refinement details

Crystal data, data collection and structure refinement details are summarized in Table 7. Hydrogen atoms potentially involved in hydrogen-bonding interactions were located by difference methods but their positional parameters were restrained in the refinement with  $N-H = 0.88$  Å and  $O-H = 0.86$  Å, and with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$  or  $1.5U_{\text{eq}}(\text{O})$ . Other H atoms were included in the refinement at calculated positions,  $C-H = 0.95$  Å, and treated as riding with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

## Crystal structures and hydrogen bonding in the isotopic series of hydrated alkali metal (K, Rb and Cs) complexes with 4-aminophenylarsonic acid

Graham Smith and Urs D. Wermuth

### Computing details

For all compounds, data collection: *CrysAlis PRO* (Rigaku OD, 2015); cell refinement: *CrysAlis PRO* (Rigaku OD, 2015); data reduction: *CrysAlis PRO* (Rigaku OD, 2015); program(s) used to solve structure: *SIR92* (Altomare *et al.*, 1993); program(s) used to refine structure: *SHELXL97* (Sheldrick, 2008) within *WinGX* (Farrugia, 2012); molecular graphics: *PLATON* (Spek, 2009); software used to prepare material for publication: *PLATON* (Spek, 2009).

### (I) Poly[di- $\mu_3$ -4-aminophenylarsonato-tri- $\mu_2$ -aqua-dipotassium]

#### Crystal data

$M_r = 564.34$

Orthorhombic,  $Cmc2_1$

Hall symbol: C 2c -2

$a = 24.3426$  (18) Å

$b = 10.4266$  (7) Å

$c = 7.8315$  (6) Å

$V = 1987.7$  (3) Å<sup>3</sup>

$Z = 4$

$F(000) = 1128$

$D_x = 1.886$  Mg m<sup>-3</sup>

Mo  $K\alpha$  radiation,  $\lambda = 0.71073$  Å

Cell parameters from 1421 reflections

$\theta = 4.1\text{--}28.7^\circ$

$\mu = 3.83$  mm<sup>-1</sup>

$T = 200$  K

Prism, colourless

0.35 × 0.22 × 0.11 mm

#### Data collection

Oxford Diffraction Gemini-S CCD-detector  
diffractometer

2874 measured reflections

1834 independent reflections

Radiation source: Enhance (Mo) X-ray source

1710 reflections with  $I > 2\sigma(I)$

Graphite monochromator

$R_{\text{int}} = 0.020$

Detector resolution: 16.077 pixels mm<sup>-1</sup>

$\theta_{\text{max}} = 29.3^\circ$ ,  $\theta_{\text{min}} = 3.2^\circ$

$\omega$  scans

$h = -32 \rightarrow 17$

Absorption correction: multi-scan

$k = -13 \rightarrow 13$

(CrysAlis PRO; Rigaku OD, 2015)

$l = -9 \rightarrow 10$

$T_{\text{min}} = 0.650$ ,  $T_{\text{max}} = 0.980$

#### Refinement

Refinement on  $F^2$

Primary atom site location: structure-invariant  
direct methods

Least-squares matrix: full

Secondary atom site location: difference Fourier  
map

$R[F^2 > 2\sigma(F^2)] = 0.030$

Hydrogen site location: inferred from  
neighbouring sites

$wR(F^2) = 0.125$

H atoms treated by a mixture of independent  
and constrained refinement

$S = 1.23$

1834 reflections

145 parameters

8 restraints

$$w = 1/[\sigma^2(F_o^2) + (0.0744P)^2]$$

$$\text{where } P = (F_o^2 + 2F_c^2)/3$$

$$(\Delta/\sigma)_{\max} = 0.001$$

$$\Delta\rho_{\max} = 0.50 \text{ e \AA}^{-3}$$

$$\Delta\rho_{\min} = -0.84 \text{ e \AA}^{-3}$$

Absolute structure: Flack (1983), 1281 Friedel pairs

Absolute structure parameter: 0.03 (2)

### Special details

**Geometry.** Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell esds are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor  $wR$  and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.

[Rb<sub>2</sub>(C<sub>6</sub>H<sub>7</sub>AsNO<sub>3</sub>)<sub>2</sub>(H<sub>2</sub>O)<sub>3</sub>]

$M_r = 657.08$

Orthorhombic,  $Cmc2_1$

Hall symbol: C 2c -2

$a = 24.4783 (19)$  Å

$b = 10.4577 (9)$  Å

$c = 8.0978 (7)$  Å

$V = 2072.9 (3)$  Å<sup>3</sup>

$Z = 4$

$F(000) = 1272$

$D_x = 2.105$  Mg m<sup>-3</sup>

Mo  $K\alpha$  radiation,  $\lambda = 0.71073$  Å

Cell parameters from 1374 reflections

$\theta = 4.0\text{--}28.7^\circ$

$\mu = 7.94$  mm<sup>-1</sup>

$T = 200$  K

Prism, colourless

0.35 × 0.20 × 0.12 mm

### Data collection

Oxford Diffraction Gemini-S CCD-detector  
diffractometer

Radiation source: Enhance (Mo) X-ray source

Graphite monochromator

Detector resolution: 16.077 pixels mm<sup>-1</sup>

$\omega$  scans

Absorption correction: multi-scan  
(CrysAlis PRO; Rigaku OD, 2015)

$T_{\min} = 0.375$ ,  $T_{\max} = 0.980$

3623 measured reflections

2093 independent reflections

1899 reflections with  $I > 2\sigma(I)$

$R_{\text{int}} = 0.026$

$\theta_{\max} = 29.0^\circ$ ,  $\theta_{\min} = 3.9^\circ$

$h = -33 \rightarrow 15$

$k = -14 \rightarrow 13$

$l = -10 \rightarrow 10$

### Refinement

Refinement on  $F^2$

Least-squares matrix: full

$R[F^2 > 2\sigma(F^2)] = 0.032$

$wR(F^2) = 0.072$

$S = 1.03$

2093 reflections

146 parameters

8 restraints

Primary atom site location: structure-invariant  
direct methods

Secondary atom site location: difference Fourier  
map

Hydrogen site location: inferred from  
neighbouring sites

H atoms treated by a mixture of independent  
and constrained refinement

$w = 1/[\sigma^2(F_o^2) + (0.0392P)^2]$   
where  $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} = 0.003$

$\Delta\rho_{\max} = 0.70$  e Å<sup>-3</sup>

$\Delta\rho_{\min} = -0.46$  e Å<sup>-3</sup>

Extinction correction: SHELXL97,  
 $F_c^* = kFc[1 + 0.001xFc^2\lambda^3/\sin(2\theta)]^{1/4}$

Extinction coefficient: 0.00306 (19)

Absolute structure: Flack (1983), 1309 Friedel  
pairs

Absolute structure parameter: -0.008 (12)

### Special details

**Geometry.** Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell esds are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor wR and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.

$Z = 4$	$0.40 \times 0.22 \times 0.10 \text{ mm}$

## Data collection

Oxford Diffraction Gemini-S CCD-detector	4941 measured reflections
diffractometer	1883 independent reflections
Radiation source: Enhance Mo X-ray source	1787 reflections with $I > 2\sigma(I)$
Graphite monochromator	$R_{\text{int}} = 0.030$
Detector resolution: 16.077 pixels $\text{mm}^{-1}$	$\theta_{\text{max}} = 29.3^\circ, \theta_{\text{min}} = 3.2^\circ$
$\omega$ scans	$h = -33 \rightarrow 29$
Absorption correction: multi-scan	$k = -14 \rightarrow 13$
(CrysAlis PRO; Rigaku OD, 2015)	$l = -11 \rightarrow 6$
$T_{\text{min}} = 0.217, T_{\text{max}} = 0.980$	

## Refinement

Refinement on $F^2$	Hydrogen site location: inferred from
Least-squares matrix: full	neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.041$	H atoms treated by a mixture of independent
$wR(F^2) = 0.160$	and constrained refinement
$S = 1.18$	$w = 1/[\sigma^2(F_o^2) + (0.1178P)^2]$
1883 reflections	where $P = (F_o^2 + 2F_c^2)/3$
145 parameters	$(\Delta/\sigma)_{\text{max}} = 0.001$
8 restraints	$\Delta\rho_{\text{max}} = 1.69 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant	$\Delta\rho_{\text{min}} = -1.00 \text{ e \AA}^{-3}$
direct methods	Absolute structure: Flack (1983), 1405 Friedel
Secondary atom site location: difference Fourier	pairs
map	Absolute structure parameter: 0.10 (4)

## Special details

**Geometry.** Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell esds are taken into account in the estimation of distances, angles and torsion angles

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor  $wR$  and goodness of fit S are based on  $F^2$ , conventional R-factors R are based on F, with F set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\text{sigma}(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on F, and R-factors based on ALL data will be even larger.
