Edited by O. Blacque, University of Zürich, Switzerland

In the title compound,  $\{[(\text{dimethylamino})\text{methyl}]\text{dimethylamine}\}\text{B}\text{H}_3$ , the tetrahedral geometry of the  $\text{N}-\text{C}-\text{N}$  unit is slightly distorted. As a result of the bulky amine substituents, a wider  $\text{N}-\text{C}-\text{N}$  angle of  $113.6(1)^\circ$  is observed. The bond lengths between the  $\text{N}$  atom and methyl groups are slightly elongated to  $1.481(2)$  and  $1.482(2)$  Å at the borated  $\text{N}$  atom, whereas the distances between the other  $\text{N}$  atom and its methyl groups are only  $1.461(2)$  and  $1.462(2)$  Å. The studied crystal was twinned. The twin data refinement was subsequently carried out with a scale factor of  $0.263(1)$ . The two lattices of the twin domains were rotated by  $179.84^\circ$ .

**Keywords:** crystal structure; borane; amine; twin.

## 1. Related literature

For background to boranes, see: Falbe & Regitz (1999). Burg & Schlesinger (1937) reported the first borane amine complex. A feature of boranes is their metal character and pronounced Lewis acidity (Huheey *et al.*, 1995). This Lewis acidity is used to enable the  $\alpha$ -deprotonation of tertiary amines (Kessar *et al.*, 1991; Ebden *et al.*, 1995). Our group frequently uses methods to deprotonate compounds in  $\alpha$ -position (Strohmann & Gessner, 2007; Gessner & Strohmann, 2012). For crystal structures containing the borated *N,N,N',N'*-tetramethyldiaminomethane motif, see: Fang *et al.* (1994); Hanic & Šubrtová (1969); Flores-Parra *et al.* (1999); Rojas-Lima *et al.* (2000). For comparison with other structures with dimethylaminoborane moiety, see: Gollas *et al.* (2013); Bera *et al.* (2011); Ramachandran *et al.* (2004); Netz *et al.* (2005). For diborated tetramethylethylenediamine, see: Chitsaz *et al.* (2001).

## Crystal structure of borated *N,N,N',N'-tetramethyldiaminomethane*

Kathrin Louven, Georgina Quentin and Carsten Strohmann

### S1. Comment

Boranes are a useful substance in today's chemistry. In 1979, Herbert C. Brown received the Nobel Prize in chemistry for his studies on these interesting compounds (Falbe & Regitz, 1999). Special about boranes is their metal character and pronounced Lewis acidity (Huheey *et al.*, 1995). This Lewis acidity is used to enable the  $\alpha$ -deprotonation of tertiary amines (Kessar *et al.*, 1991; Ebden *et al.*, 1995). Our group frequently uses methods to deprotonate compounds in  $\alpha$ -position (Gessner & Strohmann, 2007; Gessner & Strohmann, 2012). Here,  $\text{BH}_3$  was added to *N,N,N',N'-tetramethyldiaminomethane* (TMMDA) in order to deplete the nitrogen's +M-effect, smoothing the way for  $\alpha$ -lithiation. We isolated and structurally characterized the borated TMMDA for the first time. Lithiation of the product however was not successful.

The title compound crystallizes in the triclinic crystal system with space group P-1. The N–C–N-bonds are not equidistant. Longer N–C-bonds are observed for the borated nitrogen [N1–C1 1.4806 (17) Å, N1–C2 1.4818 (17) Å, N1–C3 1.5039 (16) Å] than for the other [N2–C3 1.4393 (17) Å, N2–C4 1.4612 (18) Å, N2–C5 1.4622 (18) Å]. Furthermore, bond angles at the nitrogen atoms differ. Due to steric hindrance of the methyl groups, angles on N2 are found to be broader [C3–N2–C4 112.82 (11) $^\circ$ , C3–N2–C5 112.85 (12) $^\circ$ , C4–N2–C5 110.31 (11) $^\circ$ ] than the ideal  $\text{sp}^3$ -angle of 109.5 $^\circ$ . A torsion angle of 179.82 (13) $^\circ$  can be observed for B1–N1–C3–N2, placing B1 as far away from C3 and its hydrogen atoms as possible.

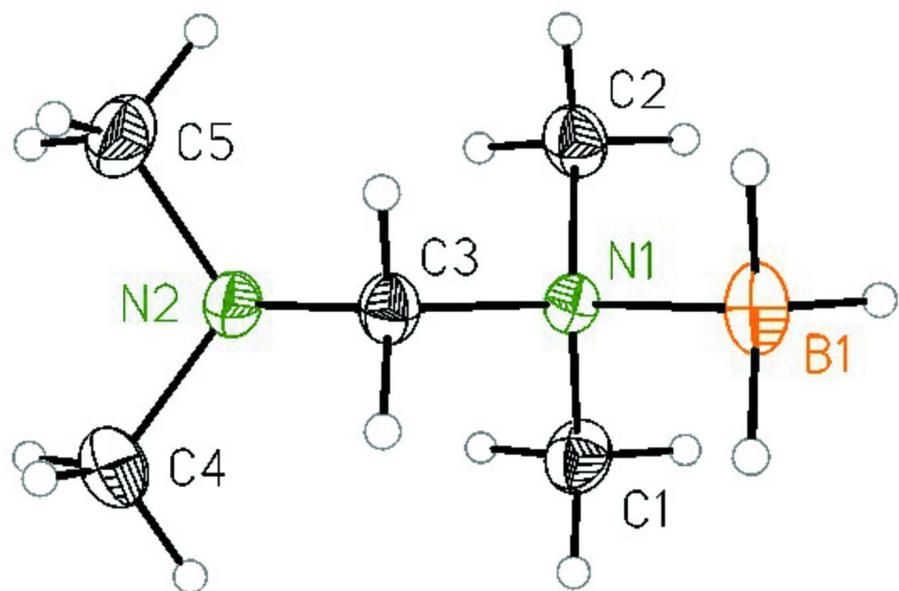

### S1.1. Experimental

$\text{BH}_3$ -solution (11.7 mL, 1 M in thf, 11.7 mmol) was added to *N,N,N',N'-tetramethyldiaminomethane* (9.79 mmol, 1.00 g) at 0 °C. The reaction mixture was stirred for 3 h at room temperature after which saturated  $\text{K}_2\text{CO}_3$ -solution (7 mL) was added. The reaction was allowed to continue for 72 h at room temperature. After extraction with  $\text{Et}_2\text{O}$  (3x10 mL), the combined extracts were dried ( $\text{Na}_2\text{SO}_4$ ). After evaporation under reduced pressure, colorless crystals precipitated (694 mg, 5.98 mmol, 61% yield).

### S1.2. Refinement

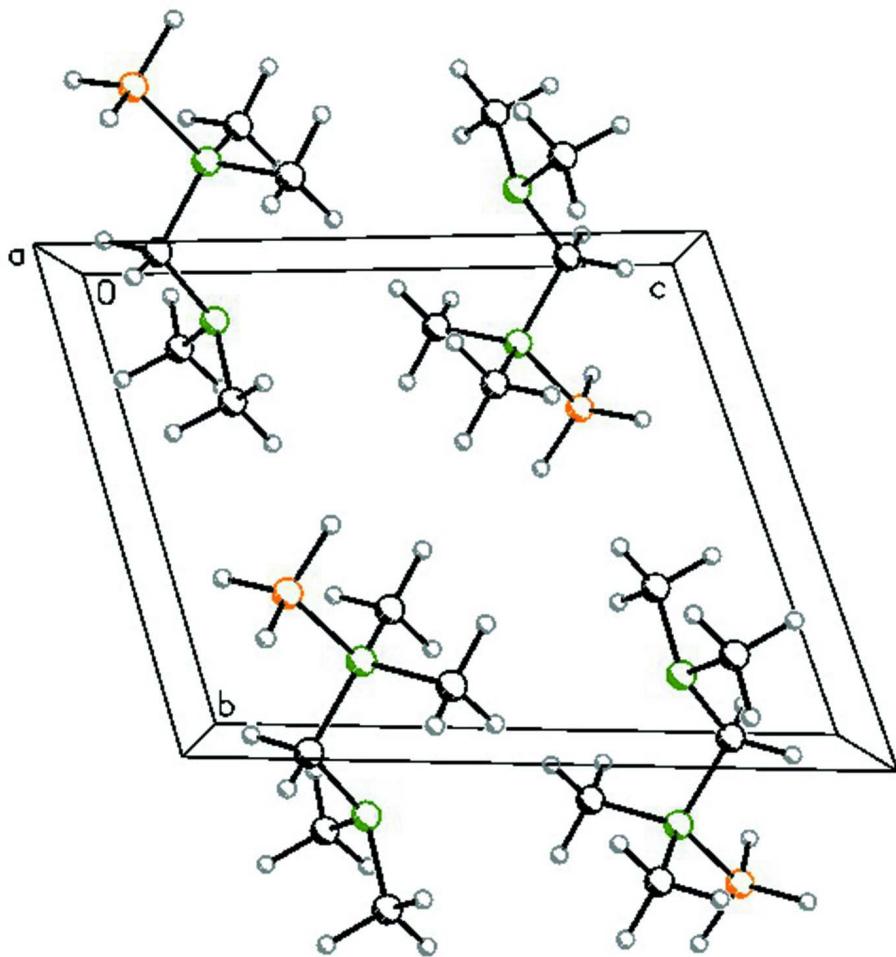

Crystal data, data collection and structure refinement details are summarized in Table 1. Hydrogen atoms linked to carbon were placed and refined by using the riding model ( $\text{C–H} = 0.95\text{--}0.99$  Å,  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$  and  $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{C})$  for terminal groups). Hydrogen atoms linked to boron were taken from difference Fourier maps.

Twin domains were found in the crystal and refined to a ratio of 0.26/0.74. The two lattices were rotated by 179.84°. HKLF5 reflelction file was used for refinement.

 $w = 1/[c^2(F_o^2) + (0.0498P)^2]$   
 where  $P = (F_o^2 + 2F_c^2)/3$   
 $(\Delta/\sigma)_{\max} = 0.001$   
 $\Delta\rho_{\max} = 0.18 \text{ e } \text{\AA}^{-3}$   
 $\Delta\rho_{\min} = -0.22 \text{ e } \text{\AA}^{-3}$

#### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refined as a 2-component twin. 1. Twinned data refinement Scales: 0.7367 (11) 0.2633 (11) 2. Fixed  $U_{\text{iso}}$  At 1.2 times of: All C(H,H) groups At 1.5 times of: All C(H,H,H) groups 3.a Secondary CH2 refined with riding coordinates: C3(H3A,H3B) 3.b Idealized Me refined as rotating group: C2(H2A,H2B,H2C), C1(H1A,H1B,H1C), C5(H5A,H5B,H5C), C4(H4A,H4B,H4C)
