In the title compounds, C₂₃H₂₇NO₂S, (I), and C₂₁H₂₃NO₂S, (II), the pyrrole rings have envelope conformations with the C atom substituted by the benzene ring as the flap. In the third title compound, C₂₀H₂₁NO₃S, (III), the isoxazole ring has a twisted conformation on the C—C bond substituted by the benzene ring and the carboxylate group. In all three compounds, the thiopyran ring has a half-chair conformation. The mean plane of the pyrrole ring is inclined to the mean plane of the thiopyran ring by 57.07 (9), 58.98 (9) and 60.34 (12)° in (I), (II) and (III), respectively. The benzene rings are inclined to one another by 73.26 (10)° in (I), 65.781° in (II) and 63.37 (13)° in (III). In the crystals of all three compounds, there are no classical hydrogen bonds present. Only in the crystal of compound (I) are molecules linked by a pair of C—H... π interactions, forming inversion dimers. The isopropyl group in compound (I) is disordered over two sets of sites and has a refined occupancy ratio of 0.586 (13):0.414 (13).

1. Chemical context

Pyrrole derivatives are of considerable synthetic importance due to their extensive use in drug discovery (Toja *et al.*, 1987) which is linked to their pharmacological activity such as anti-inflammatory (Muchowski *et al.*, 1985), cytotoxicity (Dannhardt *et al.*, 2000) and their use in the treatment of hyperlipidemias (Holub *et al.*, 2004) and as antitumour agents (Krowicki *et al.*, 1988). Other pyrrole-containing heterocyclic compounds have been reported previously for biological studies (Almerico *et al.*, 1998). Pyrrole derivatives have biological activity such as COX-1/COX-2 inhibitors (Dannhardt *et al.*, 2000) as well as cytotoxic activity against a variety of marine and human tumour models (Evans *et al.*, 2003). Isoxazoline derivatives have been shown to be efficient precursors for the preparation of many synthetic intermediates including γ -amino alcohols and β -hydroxy ketones (Kozikowski, 1984). They display interesting biological properties such as herbicidal, plant-growth regulatory and anti-tumour activities (Howe & Shelton, 1990). Chromenopyrrole compounds are used in the treatment of impulsive disorders (Caine & Koob, 1993). Continuing our interest in such compounds, we have synthesized the title compounds and report herein on their crystal structures.

OPEN ACCESS

2. Structural commentary

The title compounds (I) and (II) differ only by the substituent on the benzene ring; 4-isopropylphenyl in (I) and *o*-tolyl in (II). Compounds (II) and (III) differ only in that (II) has a pyrrole ring while (III) has an isoxazole ring.

The molecular structure of compound (I) is shown in Fig. 1. The five-membered methyl-substituted pyrrole ring adopts an envelope conformation with atom C9 as the flap, deviating from the mean plane defined by the plane of the other ring atoms by 0.0167 Å. The puckering parameters of this ring are $q_2 = 0.4713$ (15) Å and $\varphi_2 = 41.27$ (19)°. The thiopyran ring has a half-chair conformation, with the lowest asymmetry parameters $\Delta C2(S1-C7) = 8.34$ (16) Å. The mean plane of the pyrrole ring makes dihedral angles of 57.07 (9) and 63.29 (10)° with the mean plane of the thiopyran ring and the benzene ring, respectively.

The molecular structure of the compound (II) is illustrated in Fig. 2. The bond lengths and bond angles are similar to those in compound (I). The pyrrole ring (N1/C8–C12) adopts an envelope conformation with atom C9 atom as the flap having asymmetry parameters (Nardelli, 1983) $\Delta CS(C9) = 4.51$ Å and with puckering parameters $q_2 = 0.4673$ (18) Å, $\varphi_2 = 223.5$ (2)°. As in (I), the thiopyran ring has a half-chair conformation. The mean plane of the pyrrole ring is inclined to thiopyran ring mean plane and the benzene ring by 58.98 (9) and 67.75 (11)°, respectively. The carboxylate group assumes an extended conformation, as can be seen from the C8–C13–O2–C14 torsion angle of 175.4 (2)°.

Figure 1
The molecular structure of compound (I), showing the atom labelling. Displacement ellipsoids are drawn at the 30% probability level.

Figure 2
The molecular structure of compound (II), showing the atom labelling. Displacement ellipsoids are drawn at the 30% probability level.

Figure 3
The molecular structure of compound (III), showing the atom labelling. Displacement ellipsoids are drawn at the 30% probability level.

The molecular structure of molecule (III) is shown in Fig. 3. The isoxazole ring (N1/O3/C11/C8/C9) has a twist conformation about bond C9–C8: puckering parameters $q_2 =$

Table 1

Hydrogen-bond geometry (\AA , $^\circ$) for (I).

$Cg3$ is the centroid of the C1–C6 ring.

$D-H\cdots A$	$D-H$	$H\cdots A$	$D\cdots A$	$D-H\cdots A$
$C17-H17\cdots Cg3^i$	0.93	2.91	3.695 (2)	143

Symmetry code: (i) $-x + 1, -y + 1, -z$.

0.466 (2) \AA , $\varphi_2 = 275.7$ (3) $^\circ$. As in (I) and (II), the thiopyran ring has a half-chair conformation. The dihedral angles between the mean plane of the isoxazole ring and the thiopyran ring mean plane and the benzene ring are 60.34 (12) and 61.30 (14) $^\circ$, respectively. The geometric parameters of molecule (III) agree well with those reported for (I) and (II), and a closely related structure, 1-methyl-3-(naphthalen-1-yl)-3,3a,4,9b-tetrahydro-1H-chromeno[4,3-c]isoxazole-3a-carbonitrile (Gangadharan *et al.*, 2011).

3. Supramolecular features

In the crystals of compounds (I), (II) and (III), there are no classical hydrogen bonds present. Only in compound (I) is there a $C-H\cdots\pi$ interaction present, and molecules are linked by a pair of these interactions forming inversion dimers (Table 1 and Fig. 4).

Computer programs: APEX2 and SAINT (Bruker, 2008), SHELXS97 and SHELXL97 (Sheldrick, 2008), ORTEP-3 for Windows (Farrugia, 2012), Mercury (Macrae *et al.*, 2008) and PLATON (Spek, 2009).

Figure 4

A view along the b axis of the crystal packing of compound (I). The dashed cyan lines represent the $C-H\cdots$ centroid distances (see Table 1).

4. Database survey

While a search of the Cambridge Structural Database (CSD, Version 5.36, November 2014; Groom & Allen, 2014) for chromenoisoxazole derivatives revealed over 30 hits, there were no hits for thiochromenopyrroles or thiochromenoisoxazoles.

5. Synthesis and crystallization

Compound (I): To a solution of methyl (*E*)-2-[(2-formylphenyl)thio]methyl-3-phenylacrylate (1 mmol) and sarcosine (1.2 mmol) in acetonitrile (10 ml), was added pyridine (0.2 mmol) and the mixture was refluxed until completion of the reaction (monitored by TLC). The crude product was subjected to column chromatography on silica gel (100–200 mesh) using petroleum ether–ethyl acetate (9:1) as eluent, which successfully provided the pure product as a colourless solid. The product was dissolved in chloroform and heated for 2 min. The resulting solution were allowed to evaporate slowly at room temperature and yielded colourless block-like crystals of compound (I).

Compound (II): Here methyl (*E*)-2-[(2-formylphenyl)thio]methyl-3-(*o*-tolyl) acrylate (1 mmol) and sarcosine (1.2 mmol) in acetonitrile (10 ml) were reacted with pyridine following the same procedure as for compound (I), and colourless crystals of compound (II) were obtained.

Compound (III): Here methyl (*E*)-2-[(2-formylphenyl)thio]methyl-3-(*o*-tolyl) acrylate (1 mmol) and *N*-methyl hydroxylamine hydrochloride (1.1 mmol) in acetonitrile (10 ml) were reacted with pyridine following the same procedure as for compounds (I) and (II), and colourless crystals of compound (III) were obtained.

6. Refinement

Crystal data, data collection and structure refinement details are summarized in Table 2. The C-bound H atoms were positioned geometrically ($C-H = 0.93-0.98 \text{ \AA}$) and allowed to ride on their parent atoms, with $U_{iso}(H) = 1.5U_{eq}(C)$ for methyl H atoms and $1.2U_{eq}(C)$ for other H atoms. The isopropyl group in compound (I), atoms C19–C21, is disordered over two sets of sites and has a refined occupancy ratio of 0.586 (13):0.414 (13).

Acknowledgements

The authors thank the Department of Chemistry, IIT, Chennai, India, for the X-ray intensity data collection.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

mapHydrogen site location: inferred from
neighbouring sites

H-atom parameters constrained

 $w = 1/[\sigma^2(F_o^2) + (0.0591P)^2 + 0.2766P]$ where $P = (F_o^2 + 2F_c^2)/3$ $(\Delta/\sigma)_{\text{max}} < 0.001$ $\Delta\rho_{\text{max}} = 0.26 \text{ e } \text{\AA}^{-3}$ $\Delta\rho_{\text{min}} = -0.32 \text{ e } \text{\AA}^{-3}$ *Special details*

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

H-atom parameters constrained
 $w = 1/[\sigma^2(F_o^2) + (0.0267P)^2 + 3.6376P]$
 where $P = (F_o^2 + 2F_c^2)/3$

$(\Delta/\sigma)_{\max} < 0.001$
 $\Delta\rho_{\max} = 0.22 \text{ e } \text{\AA}^{-3}$
 $\Delta\rho_{\min} = -0.22 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
