

<p><b>A. Document No.:</b> PNNL-13022                      <b>Revision No.:</b> 1</p> <p><b>Document Title:</b> Groundwater Quality Assessment Plan for Single-Shell Tank Waste Management Area B-BX-BY at the Hanford Site</p> <p><b>Document's Original Author:</b> S. M. Narbutovskih</p>	<p><b>Effective Date of ICN:</b> May 7, 2002</p> <hr/> <p><b>Change Requested By:</b> S. M. Narbutovskih</p>
--	--

**B. Action:**  
 Make changes in the monitoring plan as described below in Section D. Attach this ICN in front of the document title page.

**C. Effect of Change:**  
 This ICN updates the assessment plan to reflect the addition of wells newly installed in FY2001. Project scientist will provide a schedule change request identifying the wells as new and providing a list of constituents and sample frequencies to the sample scheduler.

**D. Reason for Change/Description of Change:**

**Reason for Change:** New wells have been constructed at WMA B-BX-BY and added to the groundwater monitoring network. Groundwater procedure documentation is also updated.

**Description of Change:** This ICN updates the monitoring network for single-shell tank Waste Management area B-BX-BY with the addition of three newly installed wells and a minor change to the site's constituent list.

Changes to the groundwater monitoring network since the assessment plan was released are the addition of monitoring wells 299-E33-337, 299-E33-338 and 299-E33-339, which are added to the network as downgradient wells.

- Draw a line through page 1.3 of the original document and put the attached page 1.3 behind the old page.
- Draw a line through Table 4.1 in the original document and place the page with the new Table R4.1 behind the old page. The wells in Table R4.1, along with the sampling frequency and constituents, are subject to change as need is indicated by recent changes in groundwater chemistry.
- Draw a line through Table 4.2 in the original document and place the page with the new Table R4.2 behind the old page. The change to the constituent list consists of removing total dissolved solids and total organic halides (TOX), which are considered unnecessary since conductivity and alkalinity are measured routinely and the farms are not a source of TOX. Strontium-90 was also removed due to budget constraints but may be added periodically as needed.
- Draw a line through Table B.1a and B.2a in the original document and insert the new Tables RB.1a and RB.1b after.
- Change the first sentence under Section B.2.6 (page B.20) to read "Procedures for groundwater sampling, sample documentation and preservation, shipment, and chain-of-custody requirements are described in subcontractor manuals and in the latest quality assurance project plan (PNNL 2000)."
- Remove the following reference in Section B.2.7 (page B.21) "Bechtel Hanford Company. 1997. *Environmental Investigations Procedures*, manual BHI-EE-01."
- Add the following reference to Section B.2.7 (page B.21) "PNNL. 2000. *The Hanford Ground-Water Monitoring Project Quality Assurance Project Plan*, QA Plan ETD-012, Pacific Northwest National Laboratory, Richland, Washington."
- Remove page B.22.
- Insert the as-built diagrams for the new wells (page 6 through 11 of this ICN) after the last page of Appendix C of the original document.

**E. Document Management Decisions:**  
 See Attached Distribution List.

## 4.1 Extent of Contamination

The objective of this study is to map the level and extent of contamination observed at the WMA. Groundwater chemistry data will be acquired from the assessment wells listed in Table 4.1. Although the decision to provide continuing information on contaminant levels and extent is required by 40 CFR 265.93, other uses will be made of these data. For example the resulting contaminant plume maps will be used to assess the need for additional monitoring wells. Also the acquired data will help locate the source of contamination found west, north and northeast of the WMA. As the plumes are mapped over time, information may be provided on groundwater flow velocity. In addition, these data will help determine an appropriate sampling frequency for continued monitoring and for closure network design.

### 4.1.1 Spatial/Temporal Mapping

Based on groundwater chemistry data, contaminant plumes maps will be prepared for the contaminants of interests and for associated constituents. Detailed, contaminant maps will be constructed for selected time intervals in the past and during the assessment to evaluate temporal relationships related to plume movement. Spatial relationships between contaminants will be compared to determine differences in plume chemistry. The plume maps will also be compared to results from Section 4.3 on source chemistry signature and vadose zone source locations to provide further evidence to define sources.

The groundwater plume maps and the local flow direction will be used to determine contaminant sources. When combined with a comparison of tank and crib chemistry, the source or sources of contamination observed to the west and north-northwest can be determined. This information may also provide insight relative to the points of entry to the groundwater as well as flow migration pathways within the unconfined aquifer.

**Table R4.1.** Groundwater Monitoring Assessment Wells at WMA B-BX-BY

Original RCRA Network Wells	Assessment Network Wells
