UNREVIEWED SAFETY QUESTION (USQ) SCREENING AND EVALUATION

1. Identification Number: HNF-4989/REV 1

USQ SCREENING

Page 1 of 3

2. Title: THERMAL STABILIZATION BLEND PLAN

INSTRUCTIONS:

Respond to each question and provide justification for each response. A restatement of the question does not constitute a satisfactory justification or basis. An adequate justification provides sufficient explanation such that an independent reviewer could reach the same conclusion based on the information provided [DOE 5480.21, 10.e.1].

DESCRIPTION:

New items are added to the blend plan for thermal stabilization processing of items located outside of 213MBA.

INTRODUCTION:

The Blend Plan was written to identify items stored outside of the 213 MBA that will be moved into the MBA for thermal stabilization processing. Product quality oxide items stored in our vaults are found in Appendix A. A table is included in Appendix A which details the isotopic values for the oxide items and calculates the amount of material of any specific run that can be placed in a product can and maintain the 15 watt limit to meet storage vault specifications. This Revision of the Blend Plan adds items of lesser dose rate to lower the exposure of the workers until additional shielding can be added to the gloveboxes.

AFFECTED SSC:

This Blend Plan specifies the items that are to be thermally stabilized at the PFP plant in HA-21I and HC-21C glovebox during the processing campaign.

AUTHORIZATION BASIS:

The authorization basis documents reviewed were HNF-SD-CP-SAR-021 Revision 1 (FSAR) and WHC-SD-CP-OSR-010, Revision 0-L (OSR); specifically, section 6.4.1.1, Process Description - Reactive Material Stabilization and Solution Stabilization; section 6.4.1.2 Process Chemistry and Physical Chemistry Principles - Reactive Material Stabilization, which discuss the thermal stabilization process chemistry; section 6.4.1.4.5 Operating Limits - Reactive Material Stabilization and Plutonium-bearing Solution Stabilization and associated Table 6-5. Reactive Plutonium-Bearing Material Stabilization Operating Limits; section 9.1.3, Radioisotope-Bearing Powder Spills; section 9.1.4, Radioisotope-Bearing Pressurized Powder Container; section 9.1.8, Loss of Ventilation; section 9.1.9, Glovebox Glove Breach; section 9.1.11, Reactive Material Thermal Stabilization Process; section 9.2B.1, Accidents Postulated for the Thermal Stabilization of Plutonium Oxide Process; section 9.2B.2, Assessment of Thermal Stabilization of Plutonium Oxide Process Impacts on Original Accident Analyses; all found in the FSAR and the OSR.

CONCLUSION:

There is no need for a USQ evaluation and no change to the FSAR is needed.

REFERENCES:

None.

QUESTIONS:

1. Does the proposed change or occurrence represent a change to the facility or procedures as described in the

**UNREVIEWED SAFETY QUESTION (USQ)
SCREENING AND EVALUATION**

1. Identification Number: HNF-4989/REV 1

USQ SCREENING

Page 2 of 3

2. Title: THERMAL STABILIZATION BLEND PLAN

Authorization Basis?

☐ N/A ☒ No ☐ Yes/Maybe

BASIS: Handling of thermally stabilized material is considered normal operations. The changes to the blend plan are discussed above in the introduction. The changes to the document do not represent any change to facility or procedures as described in the Authorization Basis.

2. Does the proposed change or occurrence represent conditions that have not been analyzed in the Authorization Basis?

☐ N/A ☒ No ☐ Yes/Maybe

BASIS: Thermal stabilization of Pu bearing material does not go beyond any conditions mentioned in FSAR. Section 9.1.3, Radioisotope-Bearing Powder Spills; section 9.1.4, Radioisotope-Bearing Pressurized Powder Container; section 9.1.8, Loss of Ventilation; section 9.1.9, Glovebox Glove Breach; section 9.1.11, Reactive Material Thermal Stabilization Process; section 9.2B.1, Accidents Postulated for the Thermal Stabilization of Plutonium Oxide Process; section 9.2B.2, Assessment of Thermal Stabilization of Plutonium Oxide Process Impacts on Original Accident Analyses; section 9.2.10.1, all found in the FSAR discuss all the accidents associated with the thermal stabilization process. No new accident could be caused by the addition of more oxide items to the document as discussed in the introduction and do not represent a change to the Authorization Basis.

3. Does the proposed change represent a test or experiment NOT described in the Authorization Basis that may affect the safe operation of the facility?

☒ N/A ☐ No ☐ Yes/Maybe

BASIS: The issuance of the document does not comprise a test or experiment.

4. Does the proposed change or occurrence represent a change to the Technical Safety Requirements or a reduction in the margin of safety defined in the Technical Safety Requirements?

☐ N/A ☒ No ☐ Yes/Maybe

BASIS: No Safety Limits for PFP are specified in OSR, so a margin of safety cannot be affected. No OSR change is proposed.

If there is a YES/MAYBE response to questions 1, 2, 3, or 4, then a USQ Evaluation must be completed.

The following guidance should be considered when completing this screening. This guidance should not be considered all-inclusive; additional factors may need to be considered depending on the nature of the proposed change.

Does the proposed change:

- 1) Modify, add, or delete a safety class function of a structure, system or component stated in the authorization basis?
- 2) Alter the design of a structure, system or component as described in the authorization basis?
- 3) Modify, add, or delete the description of operation, operating environment, or analyses of any system or component described in the authorization basis?
Modify, add, delete or conflict with any of the design bases stated in the authorization basis?
- 4) Conflict with the principle or general design criteria stated in the authorization basis?
- 5) Modify, add, or delete any plant design features described in the authorization basis?
- 6) Modify, add, or delete a flow diagram or facility drawing provided in the authorization basis?
- 7) Create the potential for new system or component interactions (e.g., seismic, electrical breaker coordination)?
- 8)

PFP THERMAL STABILIZATION	BLEND PLAN	HNF-4989, REV. 1 PAGE 2 OF 51
------------------------------	------------	----------------------------------

I. INTRODUCTION

This Blend Plan documents the feed material items ~~for the thermal stabilization process that are located outside the 213 MBA. Items within the 213 MBA will be found in the classified Blend Plan, HNF-3425. This blend plan lists plutonium oxide stored in 2736-Z vaults, the 2736-ZB 638 cage, the 192C vault, and the 225 vault~~ that will be processed through the thermal stabilization furnaces.

The purpose of thermal stabilization is to heat the material to 1000 degrees Celsius to drive off all ~~watervolatile materials~~ and leave the plutonium and/or uranium as oxides. The stabilized material will be sampled to determine the Loss On Ignition (LOI) or percent water. The stabilized material must meet water content or LOI of less than 0.5% to be acceptable for storage under DOE-STD-3013-994 specifications. Out of specification material will be recycled through the furnaces until the water or LOI limits are met.

II. MATERIAL TO BE PROCESSED

~~Feed material and items were selected using the criteria in the Process Control Plan (Reference). The list in the appendix reflect the application of that criteria to the data available for each item. A classified database containing elemental weights and locations is separately available to assist operations and engineering in detailed selections.~~

A. —OXIDES

~~Theis bulk of this material is currently stored in the 2736-Z Vaults. Additional items are found in the 638 cage, 225 vault, and the 192C vault. Radiographs of some of the items indicates that some of the material is in a lead cup inside a slip lid can, a plastic bag, and two clean overpack cans. Others are in any combination of 2 to 4 overpacked cans. The material will be processed to meet DOE-STD-3013-994 specifications.~~

The batch limits imposed by the OSD on oxides are 2725 grams net weight per batch containing 2400 grams of Pu. ~~The EIS and FSAR analysis for thermal stabilization have been revised in HNF SD CP SAR 021, Rev. 1, and have been approved by DOE. The new limits are based on the criticality limits for both the individual boat/batch and the glovebox. The total Pu element weight allowed in the HC-21C glovebox by the criticality specification is 5000 grams. The total Pu element weight allowed in each individual boat/batch by the criticality specification is 2500 grams. This does not give any room for glovebox holdup. The typical glovebox holdup is about 50 grams Pu. The limit for each boat has been set at 2400 grams Pu per batch by the OSD which will allow 200 grams Pu for HC-21C glovebox holdup when two boats are being processed. Glovebox HA-211 has a glovebox limit of 7500 grams Pu which gives 300 grams available for holdup when three boats are in process.~~ To simplify calculations needed during processing, the material is assumed to be 88% Pu (typical of product quality oxide) which resulted in the net weight batch size of 2725 grams specified in the OSD. The items selected for processing will meet these limits by splitting and combining items as needed during the furnace charge

preparation process.

Some of the items in Appendix AB can be loaded into the PUREX slip lid can to exceed the vault storage specification of 15 watts/item for thermal loading. Appendix AB includes a table to be used with the Process Traveler to specify the maximum material that can be combined into one item when processing the oxide items. However, all the information on isotopic analysis was not available for all the items included in Appendix AB. The isotopic analysis will need to be determined as items are prepared for transfer to 234-5Z for thermal stabilization. As the missing data in the table at the front of Appendix AB becomes available the data table will be recalculated and the table will be reprinted as a separate spreadsheet that and can then be used for determining allowable loading of the stabilized material in the product cans. The table in Appendix AB will be used to determine which items need to have isotopic analysis performed before transfer to 234-5Z for processing.

Ordinarily, material will be processed as batches when those batches can be identified. Much of the oxide material was produced as batches and blended in a V blender batch and loaded into product cans. The product cans are identified with the same batch number with the difference in ID number being the can number for the item.

When it is not possible to identify batches the following criteria will be used to determine what materials can be mixed together in the boat charge makeup or filling of the product cans:

The isotopic contents of the original items must be similar, i.e:

- The Am-241 range cannot be greater than 0.4%
- The Pu-238 range cannot be greater than 0.11%
- The Pu-240 range cannot be greater than 5%

If only the isotopic analysis for Pu 240 is available then that will be sufficient. The criteria above for Pu 240 will be used to determine what material can be mixed together.

TOTAL ITEMS SELECTED: 580

PFP THERMAL STABILIZATION	BLEND PLAN	HNF-4989, REV. 1 PAGE 4 OF 51
------------------------------	------------	----------------------------------

III. PROCESS ORDER

Items to be processed through thermal stabilization are found in appendix A. The exact order of processing will be specified in the approved Process Traveler Sheets referred to in the Operating Instructions (OI) and will be based on guidance provided in this document and document HNF-3425. Operations and ~~Process the Cog Engineering/STA~~ will concur/determine items to process and approve each OI. The Process Travelers and the daily OI should take into consideration good ALARA practices to keep radiation dose and handling of items to a minimum. This would include processing of items from the same vault location at the same time when possible, but all material from one batch will be processed sequentially. This could entail accessing several vault locations to retrieve the necessary items for processing. ~~Other criteria in the Process Control Plan will also be adhered to during the selection of items each day.~~

The following item category codes are weapons grade (WG) material and no wattage limits are necessary. Items with the same category code can also be mixed together without problems regarding the isotopic values:

<u>102</u>	<u>28</u>	<u>36</u>	<u>41</u>
<u>42</u>	<u>43</u>	<u>5</u>	<u>51</u>
<u>61</u>	<u>62</u>	<u>63</u>	<u>64</u>
<u>73</u>			

The following item identification prefixes are not wattage limited. Items with the same prefix can be mixed together without problems regarding the isotopic values:

<u>A-*</u>	<u>BH-*</u>	<u>CAF-*</u>	<u>CCS-*</u>
<u>CCT-*</u>	<u>PZ-*</u>	<u>WEC-*</u>	

* is the rest of the item identification number.

Use the following table to determine acceptable mass limits for individual items produced during thermal stabilization of oxide items. The last column on the right contains the amount of Pu material from any run that will give 15 watts/item, which is the storage vault specification limit. If the data is missing then request isotopic analysis of the items be performed before the items are transferred to 234-5Z for processing. The STA or Cog. Engineer will then enter-use the isotopic information into calculatea spreadsheet and will provide the amount information of material needed for product can loading.
