

Waste Area Group 10, Operable Unit 10-08, Annual Monitoring Status Report for Fiscal Year 2009

February 2010

**DOE/ID-11417
Revision 0
Project No. 23368**

**Waste Area Group 10, Operable Unit 10-08,
Annual Monitoring Status Report for Fiscal Year 2009**

February 2010

**Prepared for the
U.S. Department of Energy
DOE Idaho Operations Office**

ABSTRACT

This report documents the status of Fiscal Year 2009 groundwater monitoring performed in Waste Area Group 10 at the U.S. Department of Energy Idaho National Laboratory Site, as identified in the *Groundwater Monitoring and Field Sampling Plan for Operable Unit 10-08*. Twelve of the fourteen required wells were sampled, and all ten required intervals from the Westbay wells were sampled. Two wells were not sampled because they were in the process of being converted into multiple-sample-interval Westbay wells by the U.S. Geological Survey. Groundwater samples were analyzed for volatile organic compounds identified on the Contract Laboratory Program target analyte list as well as metals (filtered), anions, and radionuclides (i.e., I-129, tritium, Tc-99, gross alpha, gross beta, and Sr-90).

No contaminant exceeded maximum contaminant levels in wells along the southern boundary of the Idaho National Laboratory Site or in guard wells. Iron was above its secondary maximum contaminant level of 300 µg/L in one well. The cause of the elevated iron concentration is uncertain. Lead was detected just below its action level. However, the zinc concentration was also elevated in these wells, and the source of the lead is probably galvanized riser pipe in the wells. Once the galvanized pipe is replaced, both lead and zinc concentrations should decline, as has been observed at other Waste Area Group 10 wells.

Waste Area Group 10, Operable Unit 10-08, Annual Monitoring Status Report for Fiscal Year 2009

1. INTRODUCTION

This report documents the status of Fiscal Year (FY) 2009 groundwater monitoring performed in Waste Area Group (WAG) 10, Operable Unit (OU) 10-08, at the U.S. Department of Energy Idaho National Laboratory (INL) Site, as identified in the *Groundwater Monitoring and Field Sampling Plan for Operable Unit 10-08* (DOE-ID 2007a). The requirement for this annual report was established in the WAG 10 Remedial Investigation/Feasibility Study Work Plan (DOE-ID 2002). This document is the last monitoring report completed under the current Field Sampling Plan (DOE-ID 2007a), which governed sampling activities only until completion of the OU 10-08 Record of Decision (DOE-ID 2009a). In addition to this annual report, previous WAG 10 sampling results are summarized in the FY 2007 and FY 2008 annual reports (DOE-ID 2008a, 2009b) and the WAG 10 Remedial Investigation/Baseline Risk Assessment (DOE-ID 2008b). Future sampling activities will be described in a WAG 10 post-Record of Decision long-term monitoring plan.

WAG 10 OU 10-08 covers areas within the INL Site that are not covered by other WAGs (Figure 1). The purpose of OU 10-08 is to address concerns about the Snake River Plain Aquifer that cannot be addressed on a WAG-specific basis. Past operations at the INL Site have introduced radioactive and hazardous contaminants into the environment, and a number of these contaminants have been found in the Snake River Plain Aquifer. Potential impacts from commingled groundwater plumes from INL Site activities were investigated as part of the WAG 10 Remedial Investigation/Baseline Risk Assessment (DOE-ID 2008b).

WAG 10 was created in accordance with the *Federal Facility Agreement and Consent Order for the Idaho National Engineering Laboratory* (DOE-ID 1991) and the “Comprehensive Environmental Response, Compensation, and Liability Act of 1980” (42 USC § 9601 et seq.), as amended by the “Superfund Amendments and Reauthorization Act of 1986 (SARA)” (Public Law 99-499).

2. OPERABLE UNIT 10-08 GROUNDWATER DATA COLLECTION PERFORMED IN FISCAL YEAR 2009

WAG 10 field sampling activities are planned and approved by the Agencies (i.e., U.S. Department of Energy, U.S. Environmental Protection Agency, and Idaho Department of Environmental Quality) through preparation of formal work planning documents (e.g., OU 10-08 Field Sampling Plan [DOE-ID 2007a]). Groundwater monitoring tasks performed in FY 2009 comprised collecting groundwater quality data and presenting the results in this report.

2.1 Groundwater Sampling Results

Wells sampled for WAG 10 are divided into five groups: boundary, guard, baseline, distal, and Westbay. Table 1 provides information about construction of WAG 10 wells, and Figure 2 shows well locations. For FY 2009, the OU 10-08 Field Sampling Plan called for sampling 14 boundary and guard wells, three sampling intervals from Westbay Well USGS-132, and seven sampling intervals from Westbay Well USGS-103. Wells USGS-105 and -108 were not sampled because the U.S. Geological Survey (USGS) was in the process of installing a Westbay system in them. Groundwater samples

a. Well identifier is from the Environmental Data Warehouse (ICP, 2009, *Environmental Data Warehouse*, <http://icpweb/edw2/>, Idaho Cleanup Project, Web page visited December 1, 2009. [Note: This Web page is on the ICP intranet and not publicly available.])

b. Pump depth is the depth to the top of the pump.

c. Well USGS-124 was in use, and the pump depth could not be determined when the well was last sampled.

d. Sampling depths for Wells MIDDLE-2050A and MIDDLE-2051 were corrected from those reported in previous monitoring reports (DOE-ID 2006, 2007b) to reflect as-built depths.

collected during June through July 2009 were analyzed for volatile organic compounds from the Contract Laboratory Program target analyte list, metals (filtered), anions, alkalinity, nitrate, and radionuclides (i.e., I-129, tritium, Tc-99, gross alpha, gross beta, and Sr-90). Appendix A provides full analytical results for each well, and Appendix B discusses the quality assurance and quality control sample results.

2.1.1 Field-Measured Parameters

Table 2 provides summary data for field-measured parameters (including temperature, pH, conductivity, and dissolved oxygen) and approximate water level at the time of sampling. Data for field parameters are included because abnormal pH (high or low) and high conductivity values can be used as indicators of contamination. The pH, temperature, conductivity, and dissolved-oxygen measurements in FY 2009 are consistent with previous measurements. The pH data indicate slightly alkaline conditions with a pH range of 7.81 to 8.45. Conductivity varies from 0.300 to 0.424 mmhos/cm, with the highest conductivity reading occurring in the uppermost interval from Well USGS-132, located south of the Radioactive Waste Management Complex (RWMC). Figure 3 shows conductivity trends for select wells. Dissolved-oxygen data indicate oxidizing conditions exist throughout the aquifer. Dissolved oxygen was measured with a flow-through cell for all the wells sampled. It is unlikely that dissolved-oxygen concentrations changed more than marginally from the in situ conditions, given the pump rates used to collect samples. Water-level data were collected from wells that were sampled using an e-line, in accordance with the latest procedure. These data are presented in Table 2. Maps showing Site-wide water levels are presented in the annual reports for FY 2004, 2005, and 2007 (DOE-ID 2005, 2006, 2008a). The water level map for June 2, 2007, is shown in Figure 4.

a. Water level measurement before sampling.

b. Temperature, dissolved oxygen, conductivity, and pH were measured using a flow-through cell.

c. Dissolved-oxygen sensors were not functioning in some wells and were replaced.

d. Water level in Well USGS-109 was not measured because the water level indicator was not functioning at the time of sampling.

e. Water level in the Highway 3 well was not measured because there is no water-level access line.

2.1.2 Radiological Analytes

Radiological analytes detected in boundary and guard wells included gross alpha, gross beta, and tritium (Table 3). These analytes measured lower than their respective maximum contaminant levels (MCLs). Concentrations of gross alpha and gross beta in WAG 10 wells were at background levels, based on background values from Knobel, Orr, and Cecil (1992). Iodine-129, Tc-99, and Sr-90 were not detected in any samples. Tritium was detected in two wells (i.e., Wells USGS-104 and -106) and in two intervals from Westbay Well USGS-103. Wells USGS-104 and -106 have a history of tritium detections with both wells exhibiting a downward trend in tritium concentrations (Figure 5).

Tritium concentrations in Well USGS-104 are currently less than 800 pCi/L and considerably less than the MCL of 20,000 pCi/L (Table 3). Tritium was detected in two intervals from Well USGS-103 at depths of 1,095.1 ft (i.e., 360 pCi/L) and 1,269.4 ft (i.e., 437 pCi/L) below ground surface (bgs). Both detections of tritium in Well USGS-103 are close to the average minimum detectable activity of 311 pCi/L for the seven samples from Well USGS-103 (Table 3).

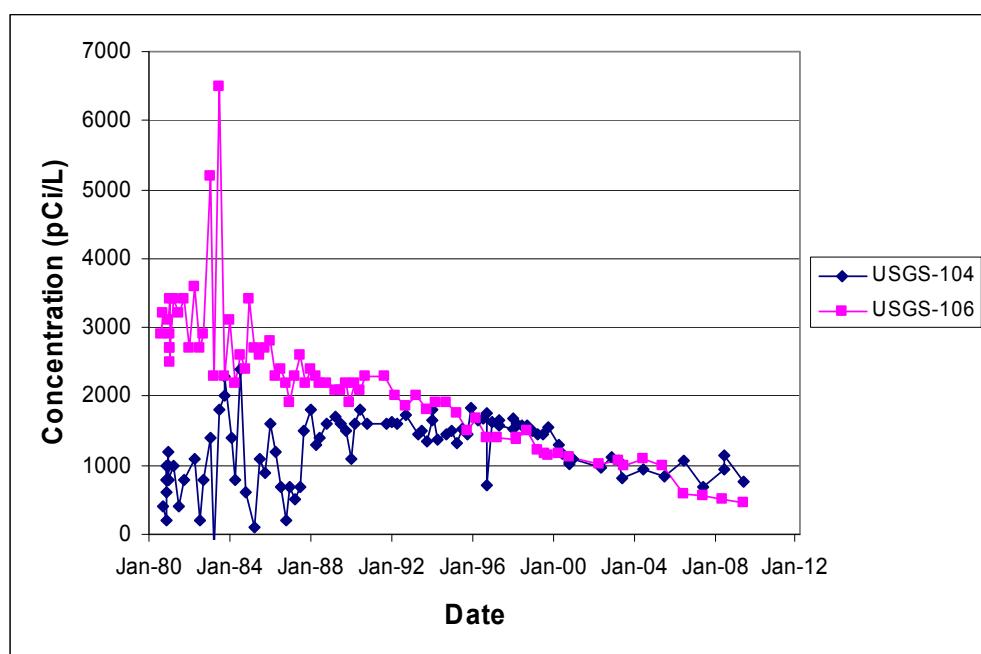

Figure 5. Tritium concentration trends for Wells USGS-104 and -106.

2.1.3 Volatile Organic Compounds

Two volatile organic compounds—toluene, and carbon tetrachloride—were detected at concentrations well below MCLs. Toluene was detected in the sample from the Highway 3 well at a concentration of 0.56 µg/L. The toluene detection was well below the MCL for toluene (i.e., 1,000 µg/L) and near the practical quantitation limit (i.e., 1 µg/L). The source of toluene in this well is uncertain. Toluene could be a laboratory contaminant; therefore, that source for the toluene cannot be ruled out. Vehicle exhaust is another possible explanation for the toluene detection because the well is located within a highway rest stop area. Carbon tetrachloride was detected in Well USGS-109, located south of RWMC on the INL Site boundary, and was also detected in one interval from Westbay Well USGS-132, located south of RWMC. The maximum detected concentration was 0.452 µg/L in the uppermost sample (i.e., 646.7 ft bgs) from Well USGS-132 south of RWMC. Detected carbon tetrachloride values are estimated or J-flagged and are close to the method detection limit. The detected carbon tetrachloride concentrations are below the MCL of 5 µg/L. A carbon tetrachloride plume originates at RWMC, and carbon tetrachloride detections probably represent migration from RWMC.

2.1.4 Metals and Anions

Table 4 provides summary data for anions, common cations, and metals and compares them to MCLs or secondary MCLs. Data also are compared to USGS background values for the INL Site (USGS 1999). When data for WAG 10 boundary and guard wells are compared to MCLs and secondary MCLs, iron is the only analyte above its MCL, secondary MCL, or U.S. Environmental Protection Agency action level. Iron was detected above its secondary MCL in one well, USGS-110. However, reported iron concentrations for several wells are inconsistent with observed dissolved-oxygen levels and slightly alkaline pH in the aquifer because iron has a very low solubility in these conditions (Figure 6). Iron concentrations in several wells have increased in recent years, but the cause of the elevated iron concentrations is uncertain. Lead occurred at concentrations of 14.1 and 13.3 µg/L in Wells USGS-100 and -106, respectively. These concentrations are close to the action level of 15 µg/L for lead. Both occurrences were in wells with above-background zinc concentration. The association of elevated lead and zinc concentrations at Wells USGS-100 and USGS-106 is probably due to corrosion of galvanized riser pipe, as discussed below.

Though not above its secondary MCL, zinc concentrations in the groundwater samples from Wells USGS-100 and USGS-106 are well above background concentrations (Figure 7). Elevated zinc concentrations in these groundwater monitoring wells are probably the result of corroding galvanized discharge or riser pipe used in their construction. Elevated zinc concentrations in groundwater have been correlated to galvanized riser pipes for other wells at the INL Site (INEEL 2003; ICP 2004). After the galvanized riser pipes in Wells USGS-86, USGS-104, and USGS-109 were replaced, zinc concentrations in those wells dropped to background levels (Figure 6). Zinc concentrations in USGS-103 have decreased in all Westbay intervals compared to zinc results before replacing the riser pipe and pump with the Westbay system.

Though not above its MCL, nitrate concentrations in Wells USGS-100 and -002—south and southwest of the Materials and Fuels Complex—have been increasing (Figure 8). In addition, nitrate concentrations in Well USGS-101 also show an increasing trend, but to a lesser extent than for Wells USGS-100 and USGS-002. Increasing nitrate concentrations can be an indicator of contamination. The spike in nitrate concentrations observed in FY 2007, at Wells USGS-100 and -002, has reverted to the long-term, slow-increase trend. The source of slowly increasing nitrate concentrations is probably migration of agricultural contamination from the northeastern boundary of the INL Site, across the eastern part of the INL Site (DOE-ID 2008a), rather than contamination from INL Site facilities. Migration of agricultural contaminants along the eastern side of the INL Site is consistent with groundwater flow paths indicated by INL Site-wide water-level measurements and the Site-wide automated monitoring network (DOE-ID 2005, 2006, 2008a).

2.2 Vertical Concentration Profiles for Westbay Wells

Westbay multilevel sampling systems were installed in Wells USGS-103 and -132 to evaluate the vertical distribution of contaminants. Well USGS-132 is located south of RWMC, and Well USGS-103 is located south of the Central Facilities Area on the southern boundary of the INL Site. Vertical distribution of analytes will be used to select possible sampling intervals for long-term monitoring.

Figure 9 shows vertical distributions of tritium, chloride, and sulfate at Well USGS-132, south of RWMC, for the three intervals sampled. Chloride and sulfate concentrations show a sharp decrease from the 646-ft sampling depth to the 774-ft sampling depth. In addition to elevated anions, carbon tetrachloride was detected in the 646-ft-depth sample. The occurrence of elevated anions and carbon tetrachloride indicates that this interval is monitoring migration from the RWMC area. This chloride and sulfate distribution is consistent with past sampling. Higher chloride and sulfate concentrations in the 646-ft-depth sample are similar to concentrations from wells that sample near the water table south of RWMC (DOE-ID 2008a, 2008b). Tritium was below the minimum detectable activity at all depths.

Figure 10 shows vertical distributions of tritium, chloride, and sulfate at Well USGS-103, which is on the southern boundary of the INL Site. Chloride concentrations show a sharp decrease from the 681.9-ft sampling depth to the 913.8-ft sampling depth. In contrast to chloride, sulfate concentrations increased slightly from the 681.9-ft depth to the 805.2-ft depth; whereas, previously, chloride and sulfate both declined. The cause of the increase in sulfate concentrations from the 681.9-ft depth to the 805.2-ft depth is uncertain. From the 913.8-ft depth to the deepest port (i.e., 1,269 ft bgs), sulfate and chloride concentrations show a slight increase. Tritium data for Well USGS-103 show detections near the minimum detectable activity at 1,095.1 and 1,269.4 ft bgs. In 2008, tritium was below the MDA in all

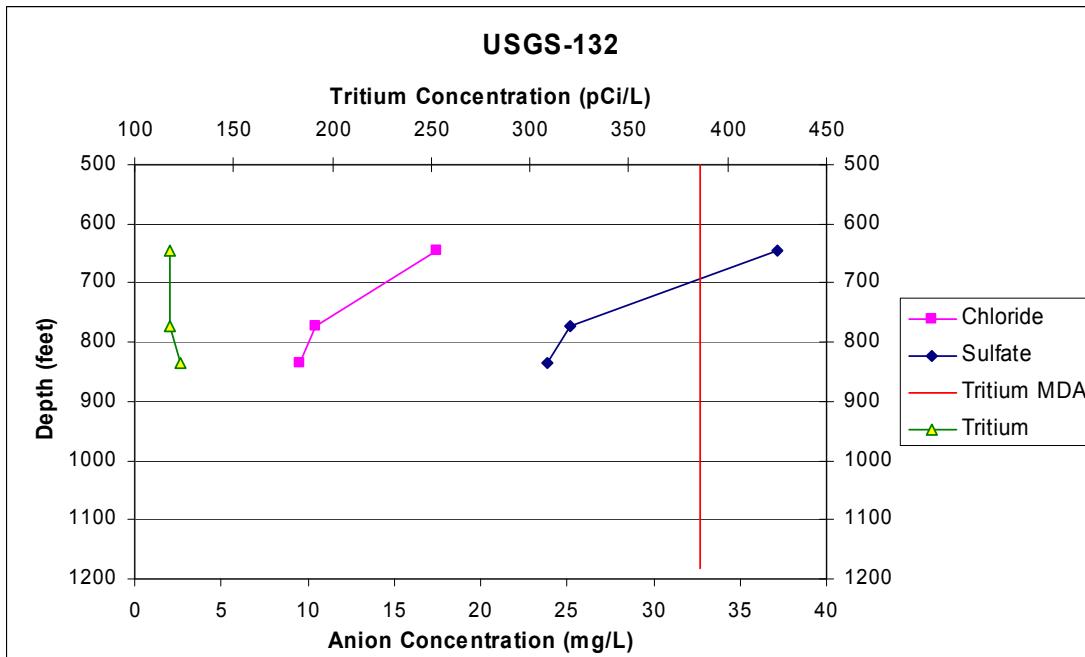

Figure 9. Vertical distribution of tritium, chloride, and sulfate in Well USGS-132.

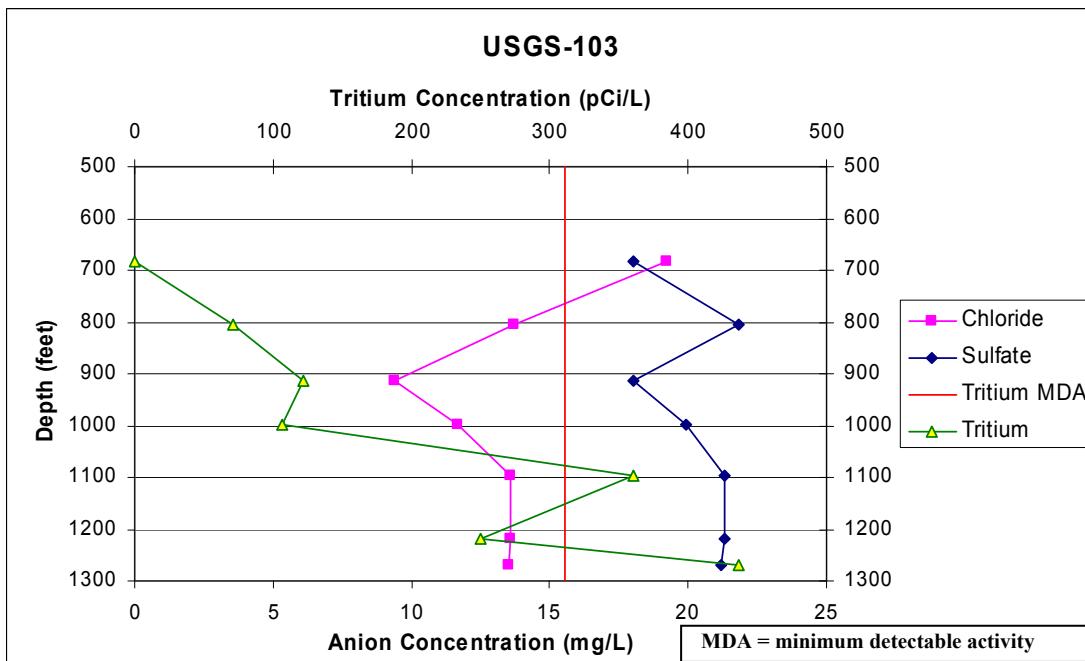

Figure 10. Vertical distribution of tritium, chloride, and sulfate in Well USGS-103.

intervals except 999 and 1,095 ft bgs; however, the result for the deepest sample (1,269 ft bgs) was flagged as non-detect because of blank contamination. The 2009 result for the 1,269-ft-depth sample yielded a value similar to the 2008 sample; however, in contrast, the 2008 result was not flagged non-detect because of blank contamination. The other difference between the 2008 and 2009 data is that tritium was detected in the 999-ft-depth sample in 2008 but not in the 2009 sample from the same depth. Because tritium measured only marginally above the MDA in 2008, the non-detect from 999-ft-depth sample in 2009 is only marginally different.

3. SUMMARY

Groundwater samples collected from 12 wells and 2 Westbay wells, with 10 sampling intervals, were sampled for OU 10-08 monitoring. During FY 2009 groundwater monitoring, no contaminant exceeded MCLs in any wells along the southern boundary of the INL Site or in the guard wells. Lead was detected just below its action level of 15 µg/L in Wells USGS-100 and USGS-106. However, the elevated lead concentrations in Wells USGS-100 and -106 are probably the result of the corrosion of galvanized riser pipes. Elevated zinc concentrations in these wells implicate the galvanized riser pipe as the cause of the elevated lead concentration. Once the galvanized pipe is replaced, both lead and zinc concentrations should decline as has been observed at other WAG 10 wells.

Iron concentration in Well USGS-110 was 361 µg/L, which is higher than its secondary MCL of 300 µg/L. However, the elevated iron concentration is not consistent with the observed high dissolved-oxygen concentrations and the slightly alkaline pH of the aquifer. Dissolved iron concentrations in the aquifer should be low due to the oxidizing conditions and slightly alkaline pH. The cause of the high iron concentrations is uncertain because the iron and dissolved oxygen data are inconsistent.

Appendix A

Analytical Results from Fiscal Year 2009 Groundwater Sampling for Waste Area Group 10

A-1. INTRODUCTION

This appendix presents groundwater analytical results from Fiscal Year (FY) 2009 for Waste Area Group (WAG) 10 at the Idaho National Laboratory Site. Table A-1 presents a summary of the analytes and analytical methods.

Table A-1. Analytes and method codes.

Analyte	Method Code	Method Description
Volatile organic compounds	SW8260B	Volatile organic compounds by gas chromatography/mass spectrometry
Sulfate, chloride, fluoride, nitrogen, nitrate/nitrite	EPA300	Inorganic anions by ion chromatography
Alkalinity, total as CaCO ₃	SM2320B-B	Bicarbonate by Standard Method 2320B
Tritium	LSC	Liquid scintillation
Metals, except mercury	SW6020	Inductively coupled plasma/mass spectrometry
Mercury	SW7470A	Mercury in liquid waste (manual cold-vapor technique)
Sr-90	GFP	Gas flow proportional counter
Tc-99	LSC	Liquid scintillation
I-129	OTR	Other radiochemical analyses
Gross alpha	GAB	Gross alpha/beta
Gross beta	GAB	Gross alpha/beta

A-2. DATA QUALIFIER FLAGS

Data qualifier flags used in this appendix comprise a consolidation of laboratory- and validation-assigned flags. Data qualifier flags for organic, inorganic, and radiological results are defined as follows:

Organic Qualifier Flags:

- B—Analyte was detected in the associated laboratory method blank as well as in the sample.
- U—Analyte was analyzed for but not detected.
- UJ—Associated value is an estimate and might be inaccurate or imprecise. The result is considered a nondetect for project data interpretation purposes.
- J—Analyte was detected, but the associated values are an estimate and might be inaccurate or imprecise.
- N—Presumptive evidence indicates that a compound is present.
- NJ or JN—Presumptive evidence indicates that a compound is present, and associated values are an estimate.
- R—Accuracy of the data is so questionable that it is recommended that the data not be used. The “R” flag overrides all other applicable flags.

Inorganic Qualifier Flags:

- B—The result is less than the contract-required reporting limit but greater than or equal to the instrument detection limit.
- E—Reported value was estimated because of the presence of interference.
- N—The spiked sample recovery was outside control limits.
- U—The analyte was not detected.
- UJ—The associated value is an estimate and might be inaccurate or imprecise. The result is considered a nondetect for project data-interpretation purposes.
- R—Accuracy of the data is so questionable that it is recommended that the data not be used. The “R” flag overrides all other applicable flags.

Radiological Qualifier Flags:

- J—The associated value is estimated. The result might not be an accurate representation of the amount of activity present in the sample.
- R—Accuracy of the data is so questionable that it is recommended that the data not be used. The “R” flag overrides all other applicable flags.

- U—The radionuclide is not considered present in the sample (i.e., nondetect).
- UJ—The radionuclide might or might not be present, and the result is considered highly questionable. The associated value is an estimate and might be inaccurate or imprecise. The result is considered a nondetect for project data interpretation purposes.

A-3. GROUNDWATER DATA

Table A-2 presents FY 2009 monitoring data for WAG 10 (i.e., boundary, guard, and Westbay wells). The complete groundwater data set (in Excel) is provided on the compact disc attached to the inside back cover of this report.

Note that alkalinity data are reported in units of mg/L as calcium carbonate. In Table A-2 and on the compact disc, samples and duplicate samples are designated as 01 and 02 before the two-character analysis code. For example, sample GWA047022X is the duplicate metals sample for GWA047012X from Well USGS-104. The analytical result and a “U” flag is the practical quantitation limit for the nonradiological analytes.

Appendix B

Quality Assurance and Quality Control Sample Results from Fiscal Year 2009 Groundwater Sampling

Appendix B

Quality Assurance and Quality Control Sample Results from Fiscal Year 2009 Groundwater Sampling

B-1. QUALITY ASSURANCE AND QUALITY CONTROL SAMPLING

The purpose of collecting and analyzing quality assurance and quality control samples is to confirm that project objectives and data quality objectives have been achieved. Overall objectives associated with Idaho National Laboratory (INL) Waste Area Group (WAG) 10 annual groundwater monitoring are discussed in *Groundwater Monitoring and Field Sampling Plan for Operable Unit 10-08* (DOE-ID 2007). The following subsections discuss overall objectives and quality assurance and quality control sample results for the Fiscal Year (FY) 2009 sampling effort.

B-1.1 Precision and Accuracy

Spatial variations in concentrations of contaminants at individual sites create sampling variability. Additional variability, called measurement error, occurs during sample collection, handling, processing, analysis, quality evaluation, and reporting. Concentrations of contaminants reported may differ from true concentrations in the media sampled as a result of measurement error, which can be minimized but not eliminated. Though it may not be significant in many cases, it is important to assess the contribution of measurement error to the total error in individual investigations. Analytical results of quality control samples are used to estimate (1) accuracy and precision, (2) quantitative descriptions of measurement error, and (3) bias.

B-1.1.1 Overall Precision

Precision is a measure of the reproducibility of measurements under a given set of conditions. In the field, precision is affected by sample-collection procedures and natural heterogeneity of the matrix. Overall precision (field and laboratory) can be evaluated by using duplicate samples collected in the field. Typically, greater precision is required for analytes with very low action levels that are close to background concentrations. Allowable laboratory precision for water samples is defined as having a relative percent difference (RPD) of less than or equal to 20%. Field precision is the difference between overall precision and laboratory precision. Duplicate samples were taken at Wells USGS-104 and USGS-106. Table B-1 summarizes precision for the FY 2009 groundwater monitoring. Using the formula in Equation (B-1), RPD was calculated only for those samples that had true positive values for both the initial sample and the field duplicate:

$$RPD = \frac{|S - D|}{S + D} \times 200 \quad (B-1)$$

Where

S = sample

D = duplicate.

Table B-1. Overall precision for Fiscal Year 2009 analytical data.

Analyte	Units	Sample	Duplicate	Relative Percent Difference
USGS-106				
Alkalinity, total as CaCO ₃	mg/L	155	155	0.00
Barium	µg/L	46.8	47	0.43
Cadmium	µg/L	0.288	0.24	18.18
Calcium	µg/L	43,300	41,600	4.00
Chloride	mg/L	14.9	15	0.67
Chromium	µg/L	6.93	6.85	1.16
Cobalt	µg/L	4.33	0.229	179.91
Copper	µg/L	1.03	1.02	0.98
Fluoride	mg/L	0.211	0.192	9.43
Gross beta	pCi/L	3.42	2.59	27.62
Iron	µg/L	184	177	3.88
Lead	µg/L	13.2	13.3	0.75
Magnesium	µg/L	17,100	16,300	4.79
Nickel	µg/L	1.43	0.984	36.95
Nitrogen, nitrate/nitrite	mg N/L	1.04	1.04	0.00
Potassium	µg/L	2,150	2,000	7.23
Sodium	µg/L	7,160	7,220	0.83
Strontium	µg/L	226	226	0.00
Tritium	mg/L	467	435	7.10
Uranium	µg/L	1.7	1.64	3.59
Zinc	µg/L	161	165	2.45
USGS-104				
Alkalinity, total as CaCO ₃	mg/L	122	121	0.82
Barium	µg/L	31.5	31	1.60
Calcium	µg/L	35,000	33,400	4.68
Chloride	mg/L	13.1	13	0.77
Chromium	µg/L	7.62	9.91	26.13
Fluoride	µg/L	0.231	0.23	0.43
Gross beta	pCi/L	1.62	3.35	69.62
Iron	µg/L	94	77.9	18.73
Magnesium	µg/L	13,300	12,500	6.20
Nickel	µg/L	1.1	1.02	7.55
Nitrogen, nitrate/nitrite	mg N/L	0.905	0.905	0.00
Potassium	µg/L	2,640	2,500	5.45
Sodium	µg/L	8,960	8,160	9.35
Strontium	µg/L	209	207	0.96
Sulfate	mg/L	20.6	20.6	0.00
Tritium	pCi/L	753	567	28.18
Uranium	µg/L	1.83	1.83	0.00

Table B-1 shows samples in which the analyte is detected in both the sample and the duplicate. Precision for the data in Table B-1 is acceptable, except for chromium, gross beta, and tritium in Well USGS-104 and cobalt, gross beta, and nickel in Well USGS-106. All unacceptable RPDs were close to the detection limit. Consequently, small differences in concentration near the detection limit can result in a large RPD. However, from the project-data-use perspective, concentration numbers are the same for data interpretation purposes and are, therefore, viewed as acceptable.

B-1.1.2 Overall Accuracy

Accuracy is a measure of bias in a measurement system. Accuracy is affected by methods used for sample preservation, sample handling, field contamination, and sample matrix. Effects of the first three methods are evaluated using the field blank, trip blank, and equipment rinsate results. The presence of a contaminant in the field blank, trip blank, or rinsate reveals that cross-contamination has occurred.

Laboratory accuracy is ensured through use of standard methods and calibration standards from the National Institute of Standards and Technology. All instrumentation is calibrated before use, in accordance with procedures outlined in the analytical methods required by INL Sample and Analysis Management (SAM) statements of work. Laboratory accuracy is assessed through use of matrix spikes and laboratory control samples. The number of laboratory quality control samples is specified in analytical methods employed in INL SAM statements of work. Evaluation criteria for quality control samples are specified in data validation technical procedures administered by INL SAM. For samples analyzed in accordance with the U.S. Environmental Protection Agency (EPA) Contract Laboratory Program protocol, validation is also performed in accordance with that protocol. Overall accuracy of the analyses is acceptable for the FY 2009 data set.

B-1.1.3 Representativeness

Representativeness is a qualitative parameter that expresses the degree to which sampling and analysis data accurately and precisely represent the characteristic of a population parameter that drives an action to be taken. Representativeness is evaluated by determining whether measurements were accurate and whether samples represent actual concentrations in the aquifer.

For the FY 2009 sampling activity, all measurements were made according to established EPA and INL SAM protocol. Trained personnel followed established INL procedures to collect physical samples.

B-1.1.4 Comparability

Comparability is a qualitative characteristic that refers to the confidence with which one data set can be compared to another. At a minimum, comparable data must be obtained using unbiased sampling designs. If sampling designs are biased, the reasons for selecting another design should be well documented. Data comparability for this sampling activity was ensured through the following efforts:

- All data sets contained the same variables of interest
- All measurements were performed and results were reported using common units
- Similar analytical procedures and quality assurance measures were used
- All field and laboratory instrumentation had detection limits that were similar to or better than those historically employed
- Established INL procedures were followed during sample collection
- Wells selected for sampling were identical to those chosen historically.

Sampling rounds are conducted at approximately the same time of year in an effort to negate any effect that changes in groundwater levels (e.g., caused by snowmelt and runoff) may have on data.

B-1.2 Completeness

The completeness goal for WAG 10 sampling is 90%. During the FY 2009 sampling event, 12 of 14 groundwater wells were sampled, and 10 of 10 Westbay intervals were sampled. The completeness was 25 of 27 total samples or 92.6 %, thus exceeding the completeness goal of 90%.

B-1.3 Data Validation

Method data validation is the process whereby analytical data are reviewed against set criteria to ensure that the results conform to requirements of the analytical method and any other specified requirements. Laboratory data for the June–July 2009 sampling event were validated to Level B in accordance with established INL SAM and EPA protocols. The limitations and validation reports were transmitted to the regulatory agencies (i.e., U.S. Department of Energy, EPA, and Idaho Department of Environmental Quality) in October 2009. No major problems were identified during this method validation process.

B-1.4 Performance Evaluation Samples

Radioanalytical performance evaluation water samples GWA05501RH, GWA05501R8, and GWA05501UX were submitted to GEL Laboratories, LLC, as double-blind performance evaluation samples included with the WAG 10 FY 2009 annual sampling event. Performance evaluation samples were prepared by the U.S. Department of Energy (DOE) Radiological and Environmental Sciences Laboratory (RESL). The goal of performance evaluation samples was to assess the laboratory's proficiency in performing routine radioanalytical measurements.

Radioanalytical results were evaluated using the electronic data system at DOE RESL. For a result to be acceptable, the statistical difference between the laboratory result and the known value must be within 3-sigma, and the laboratory result must be within $\pm 30\%$ of the known value. The results met acceptance criteria established by DOE RESL, except for tritium and I-129 (Table B-2). The tritium result for GWA05501R8 is evaluated as not acceptable because the statistical difference of the sample result and the known value was greater than 3-sigma, and the laboratory/reference value ratio was not within the acceptance range. The I-129 result for GWA05501UX is evaluated as not acceptable because the statistical difference of the sample result and the known value was greater than 3-sigma, and the laboratory/reference value ratio was not within the acceptance range (i.e., sample result is low-biased).

An investigation of the unacceptable tritium results and a description of the corrective action taken were requested from the GEL Laboratories. The lab determined that the tritium sample probably was not loaded into the scintillation cocktail, which resulted in the original failing to be within the acceptable range for the performance evaluation sample. Consequently, the original performance evaluation sample was shaken and recounted. The reanalysis result yielded an acceptable result. The corrective action identified was for GEL Laboratories to train liquid-scintillation-counting analysts to ensure that samples are shaken sufficiently before counting is performed to ensure that the sample is loaded into the scintillation cocktail. The corrective action training was completed on October 22, 2009.

GEL Laboratories investigated the unacceptable result for I-129 and found an issue with a detector. The original performance evaluation sample result was biased low. However, a reanalysis of the performance evaluation sample produced a result that was acceptable. The detector used when the low result was obtained was removed from service. The corrective action identified by GEL Laboratories was to train the gamma spectroscopy analysts and associated review staff on pertinent criteria when evaluating a sample. The corrective action training was completed on October 22, 2009.

Table B-2. Performance evaluation sample results for Fiscal Year 2009.

Performance Evaluation Sample Identification	Nuclide	Reference Activity (pCi/L)	Lab Result ^a (pCi/L)	Ratio Lab/Ref ^b	Agreement
GWA05501RH	Sr-90	Blank	$2 \pm 9 \text{ E-02}$	—	Yes
GWA05501RH	Tc-99	$2.4 \pm 0.07 \text{ E+01}$	$2.8 \pm 0.3 \text{ E+01}$	1.16	Yes
GWA05501UX	I-129	$5.03 \pm 0.12 \text{ E}0$	$2.66 \pm 0.15 \text{ E}0$	0.53	No
Reanalysis			$5.08 \pm 0.394 \text{ E}0$	1.01	Yes
GWA05501R8	H-3	$1.17 \pm 0.03 \text{ E+04}$	$7.8 \pm 0.8 \text{ E+03}$	0.67	No
Reanalysis			$1.42 \pm 0.141 \text{ E+04}$	1.21	Yes

a. Experimental result uncertainty reported as 1-sigma.
b. Laboratory result/reference value.
