Small Prime Solutions to Cubic Diophantine Equations

Zhixin Liu

Abstract. Let $a_1, \cdots, a_9$ be non-zero integers and n any integer. Suppose that $a_1 + \cdots + a_9 \equiv n \pmod 2$ and $(a_i, a_j) = 1$ for $1 \leq i < j \leq 9$. In this paper we prove that (i) if a_j are not all of the same sign, then the above cubic equation has prime solutions satisfying $p_j \ll |n|^{1/3} + \max\{|a_j|\}^{14+\varepsilon}$; and (ii) if all a_j are positive and $n \gg \max\{|a_j|\}^{43+\varepsilon}$, then the cubic equation $a_1 p_1^3 + \cdots + a_9 p_9^3 = n$ is soluble in primes p_j. This result is the extension of the linear and quadratic relative problems.
