**Abstract.** As the country has introduced a number of policies on environmental protection, there are more detailed protection regulations for all aspects of environmental protection, and many of the previously unacceptable issues have become law-abiding. However, on the level of environmental protection awareness, it cannot be as immediate as the law. It will be a long process. After the inheritance and development of generations and generations, the awareness of environmental protection will strengthen our survival. The environment is more protected.

## 1. Environmental awareness

Environmental awareness is the activity of the human nervous system to understand the things around it. It is a product that is gradually formed in the human brain and is the entire ideological understanding of the environment. Human activities are attached to the natural environment, and the environment restricts human activities, which in turn counteracts the environment. Human environmental awareness is generated in the practice of life and production, and the interdependence and restriction of people and the environment. The process is based on the process of thinking in the process of understanding and transforming nature. The most important point of human beings at the top of the biological chain is the ability of human thinking. There are conscious activities of thinking activities, and conscious activities receive the influence of the entire social environment factors. Environmental protection awareness is a kind of experience, judgment concept, emotional attitude and practice behavior about environmental protection knowledge that is gradually formed in the process of human beings living in the natural environment [1].

In ancient China, there was a sense of environmental protection, which dates back to the period of the ancient Xia Dynasty. In the "Yi Zhou Shu·Da Ju Pian" records, Daxie issued a ban when he was in office: "Spring March, the forest does not climb the axe, to become the longest of the grass. In the summer of March, Kawakawa does not enter the outline, to the length of the adult fish." It can be seen that the early awareness of environmental protection based on sustainable development has made specific time arrangements for mountain bans and fishing breaks to facilitate ecological restoration.

## 2. The significance of environmental protection awareness

Human social consciousness can have a positive or negative effect on the natural environment. The ideology is more complicated, and it is related to the understanding activities of the whole comprehensive aspect. Human environmental awareness is not innate. First, it is realized by practicing activities. Secondly, it inherits the predecessors' understanding of mitigating the right and wrong of the environment. Both of them are learning to deepen the order process.

Based on learning, in the government-led environmental protection, the public's environmental awareness level can be used vigorously. The awareness of our people that environmental protection does not participate or contribute is deeply rooted. Studies have shown that the sooner you receive environmental protection education, the stronger your awareness of environmental protection. In order to change such awareness of environmental protection, it is necessary to vigorously strengthen the education of environmental protection, especially in low- and young-age children.

## 3. Based on the cultivation of environmental awareness in school teaching

The basic textbook for environmental protection is a tool for environmental protection awareness. In the curriculum of low and young children, schools should carry out environmental protection-related courses, and have special textbooks or reference books as guidelines for case analysis or knowledge experience. Introduction [2].

Through the beginning of the awareness of environmental protection for students, the participation of all citizens who are gradually expanding is reflected in actions to protect, improve and build the environment. Establishing a correct awareness of environmental protection is an important part of socialization, modernization, scientific and human culture. It can influence all aspects of the city, including politics, economy, and culture. Scientific awareness and other environmental awareness are also one of the indicators that modern cities need to achieve.

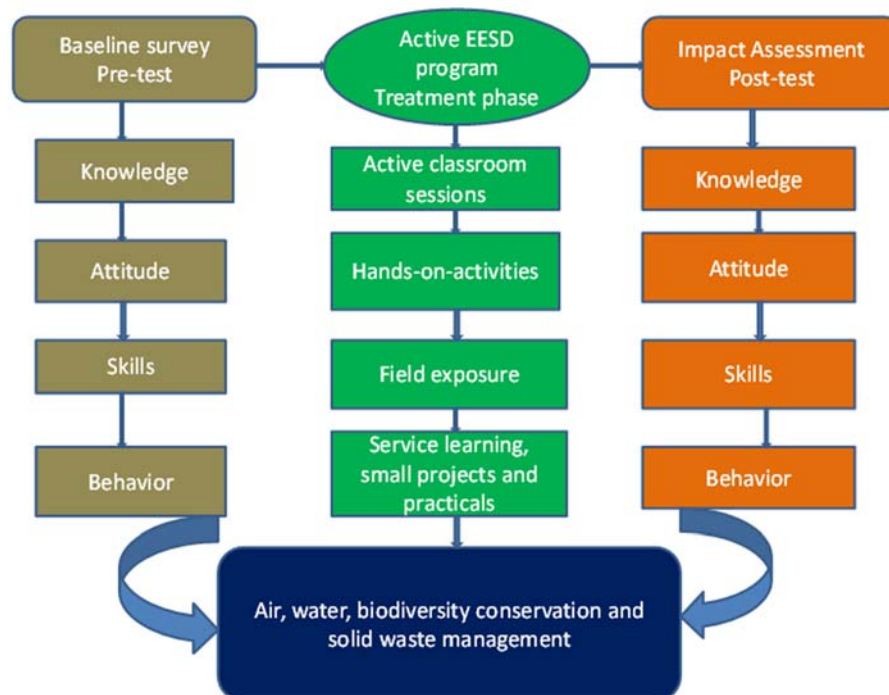

**Figure 1.** Triple performance of teaching environmental protection awareness

## 4. Cultivation of environmental protection awareness based on communication mode

Environmental protection is not difficult for everyone. The main thing that needs to be solved is to remove its deep-rooted thinking mode. Under today's diverse activities, it is necessary to be able to grasp the importance of communication, not only to spread the awareness of environmental protection. In the

education of environmental protection and propaganda, it is also necessary to experience the environmental protection through hands-on experience, and encourage everyone to actively participate in environmental protection, even if only a little effort is exerted, but the convergence can be changed a lot.

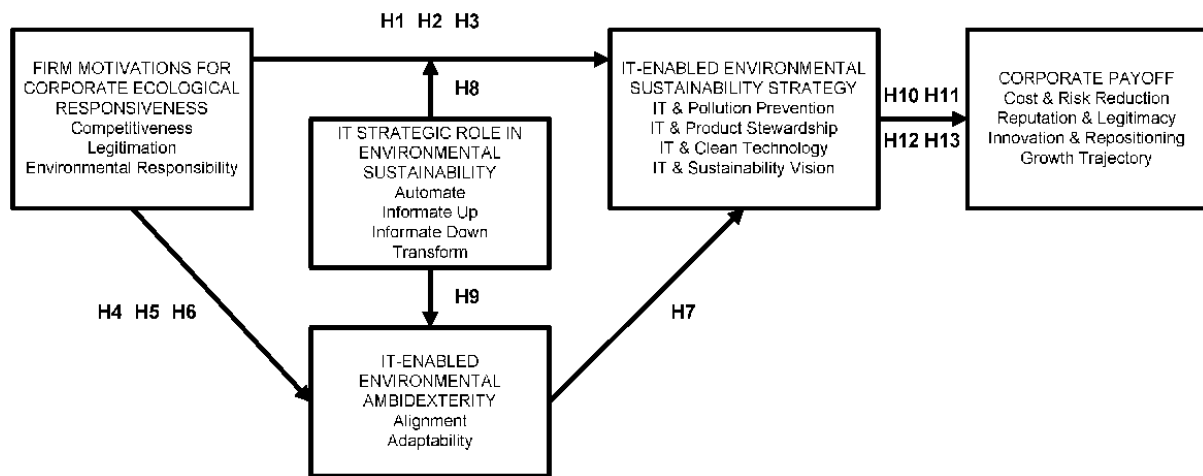

In the medium of traditional media and new media, new media is an important way to change, let people not only understand through reading, but through reading to practice in person. This requires the novelty of the communication model [3], which can be propagated in an interactive mode, and the environmental information is mobile to realize real-time sharing of information dissemination. Based on the participation of new media technologies, the source of information has been greatly expanded, and the disclosure of environmental issues has been timelier.

## 5. Sustainable development strategy

The development of modern economic design has caused conflicts between human and natural environment. The environment in which human beings are living is being destroyed, and survival is threatened, such as pollution, population surge, and water shortage, global warming, rising water level, extreme weather, etc. Through these various cases, people can realize that the human and natural environment should not be plundered and plundered, conquered and conquered. The old stereotypes and values of the people who need to change are in keeping with the pace of development in the modern era. Rationalize the relationship between man and nature, reorient people to live in harmony with the natural environment. For the development of economy and society, it is precondition for protecting the environment. Adhere to the sustainable development strategy, abide by the laws and regulations formulated by the government, and leave a suitable living space for future generations.

## 6. Conclusion

The 19th National Congress of China pointed out that it is necessary to establish and practice the concept of green mountains and green mountains. Environmental protection and sustainable development are the current direction of social development. In the cultivation of environmental protection awareness, we must establish a "person-involved" thinking mode from an early age. In education, we must increase investment, optimize education models, continue to innovate, and disseminate through new media and other forms. Many people can feel the benefits of environmental protection and cultivate everyone's awareness of environmental protection. Only in this way can we better build our beautiful home.
