

## ABSTRACT

**LEVINE, JONATHAN D.** Use of the O\*NET Descriptors in Numerical Occupational Classification: An Exploratory Study (Under the direction of Dr. J.W. Cunningham)

The present study explored the usefulness of four O\*NET descriptor domains, Knowledge, Skills, Abilities, and Generalized Work Activities, as tools in occupational classification and in estimating O\*NET Job Zones reflecting the education, training, experience requirements (i.e., O\*NET Job Zones) of occupations. First, assignment analyses were carried out to compare how accurately different association measure – variable set combinations assigned occupations to their parent Standard Occupational Classification (SOC) groups. The  $d^2$  – O\*NET domain factor combination yielded a high assignment rate and was used in all subsequent analyses.

Second, unstructured and structured numerical cluster analyses were carried out at different levels of the SOC. An unstructured, overall analysis produced some clusters that matched well with Major Groups in the SOC's hierarchical structure. Subsequent structured analyses within groups at two different levels of the SOC produced many clusters that matched well with both SOC Minor Groups and Broad Occupational Groups, oftentimes yielding 100 percent membership overlap. Although numerical occupational clustering based on the O\*NET domain factors did not produce a meaningful alternative to the SOC, it did provide some empirical support for the SOC at the Major Group, Minor Group, and Broad Occupation levels. Finally, an *a priori* matrix classification approach employing SOC Major Groups and O\*NET Job Zones did not yield a meaningful occupational structure.

Regression and discriminant analyses were carried out to explore whether O\*NET domain factors would be useful in estimating job zone assignments for occupations. Initial regression analyses with O\*NET domain factors as the independent variables and Job Zone as the dependent variable yielded an R value of .80 ( $p < .001$ ). A discriminant analysis provided further evidence that O\*NET descriptors may be useful in assigning Job Zones to new and emerging occupations.

## **DEDICATION**

I dedicate this work to my wife, Stefanie, my son, Joshua the prince, and my little princess, Samantha. They brighten each day and make life worth living. Without them, none of this would matter.

## BIOGRAPHY

Jonathan D. Levine resides in Tampa, Florida, where he is President of *Workforce Dynamics*, a human resources/industrial-organizational (I-O) consulting firm. He received a Bachelors degree with honors in Psychology from the University of Florida. He later received his Masters degree in I-O psychology from North Carolina State University in 1998. His areas of interest are job and occupational classification and the online career services world. He has special expertise in government programs and systems, such as the Occupational Information Network (O\*NET) and the Standard Occupational Classification (SOC).

## **ACKNOWLEDGEMENTS**

I would like to thank the following people for their generous contributions to the completion of this work:

- My wife, Stefanie, for your love, support, and guidance through all the good and hard times. My son, Joshua and daughter, Samantha, for the thousands of smiles you brought to my face each day.
- My parents, Ed and Rose Levine, and my brothers, Adam and Daniel, for your love and support. Thank you.
- My in-laws, Judi and Barry Lieberman, for your love and support. Thank you.
- Dr. Bill Cunningham, I-O professor emeritus, North Carolina State University – as my committee chair and adviser, you have provided unparalleled guidance and support during the course of this project, both educationally and personally. I owe you many thanks. It has surely been a long road, but I have truly enjoyed and gained much from the experience.
- My committee members, Dr. Don Drewes, Dr. Mark Wilson, and Dr. Mike Wogalter – I appreciate the support and efforts put forth in helping me get this masterpiece finished. Dr. Drewes, I owe you special thanks for assistance with SAS programming.
- Ron Boese, Research Consultant, National Center for O\*NET Development – your data management work with various O\*NET data sets was vital in the preparations for a subsequent, smooth data analysis effort. Thanks, Ron.

- Dr. Mike Brannick, I-O professor, University of South Florida – your assistance with some difficult SAS programming was instrumental in the completion of the data analyses.
- Darnell Johnson – your help and dedication over the years, right up until the end, is much appreciated. Thank you.

# Use of the O\*NET Descriptors in Numerical Occupational Classification:

## An Exploratory Study

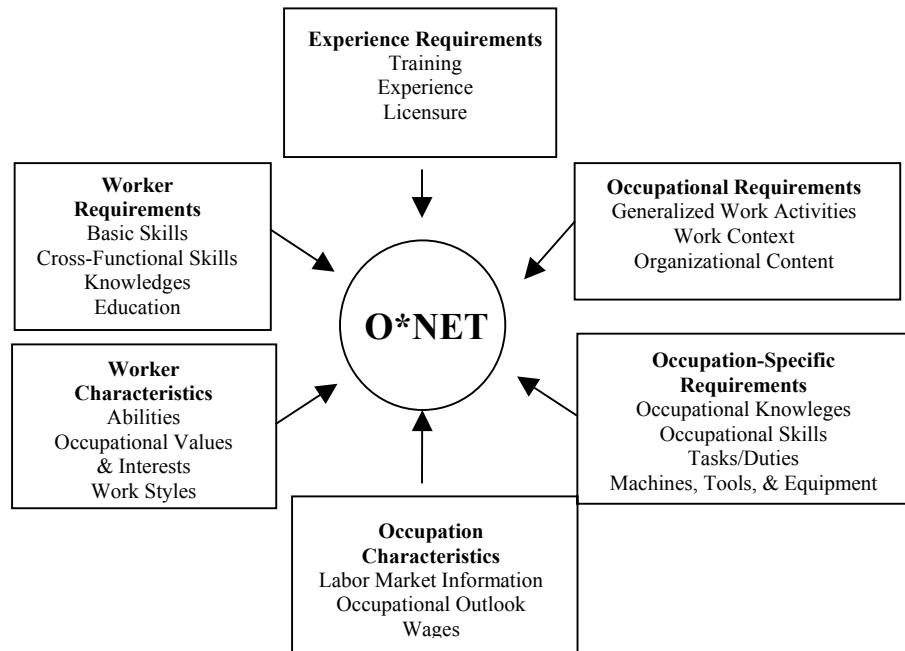

### INTRODUCTION

The Standard Occupational Classification (SOC) is a 4-tiered taxonomic system developed and updated by the Bureau of Labor Statistics (BLS; U.S. DOL/BLS, 1999). It consists of (from general to specific) 23 Major Groups, 96 Minor Groups, 449 Broad Occupations, and 821 Detailed Occupations. The Office of Management and Budget recently mandated that all federal government-reporting agencies adopt and incorporate the SOC into their job systems. The SOC will serve to replace many different job classification schemes (e.g., the Occupational Employment Statistics system, the Census classification, America's Job Bank, and the Occupational Information Network). It may also be thought of as a common occupational coding system that will allow various government agencies to more easily communicate with each other and share data. The National Center for O\*NET Development (O\*NET Center) was the first government agency to adopt and convert its occupational system to the SOC.

O\*NET is the United States Department of Labor's (U.S. DOL) replacement for the Dictionary of Occupational Titles (DOT). O\*NET reduced the DOT's over twelve thousand occupational titles to a smaller, more manageable 1,122. O\*NET, unlike the SOC, is more than just an occupational grouping structure. Underlying O\*NET is a conceptual framework known as the Content Model. The Content Model "...summarizes the specific types of variables that would be needed to adequately describe characteristics and requirements of both the worker and the work" (Mumford & Peterson, 1999; p. 25).

Figure 1 on the following page presents a visual of the O\*NET Content Model.

Figure 1. The O\*NET Content Model

O\*NET also offers a database containing knowledge, skill, ability, general work activity, work style, training and education, task, and work context data that all describe its occupations. All of these data together serve as a valuable vocational guidance and career exploration tool (e.g., see O\*NET's Web-based application known as the Online Viewer, <http://online.onetcenter.org/>). O\*NET data have also been used to develop online assessment systems (e.g., [www.careerway.com](http://www.careerway.com)), create job descriptions (e.g., [www.hiringtools.com](http://www.hiringtools.com)), and facilitate research efforts in the field of industrial-organizational psychology (e.g., Kubisiak, 2002).

The O\*NET Center recently converted its system to a SOC-based system, which now contains 974 occupations. Upon conversion to the SOC, most of the original O\*NET occupational units (OUs) became specific SOC occupations, while some OUs remained and became a fifth, more detailed breakout of some of the specific SOC occupations. The new SOC-based coding system that was incorporated into O\*NET's taxonomy reflects the complex transition to what is now known as the O\*NET-SOC system (Levine, Nottingham, Paige, and Lewis, 1999). The O\*NET-SOC system will be discussed in greater detail later in the literature review.

Both the SOC and O\*NET-SOC systems were developed using primarily qualitative means (i.e., judgments made by trained BLS and other government agency staff, job and occupational analysts, and industrial-organizational psychologists). The O\*NET conversion to the SOC, in particular, was completed based on the judgments of a small number of government personnel. However, with the increased use of computers, quantitative classification techniques are possible. This has led to the growth of what Cunningham (1996) referred to as numerical occupational classification. Should the appropriate data be available, quantitative methods exist allowing for the empirical grouping of jobs. One such method in the broadest sense is known as cluster analysis.

Aldenderfer & Blashfield (1984), Harvey (1986), and Mirkin (1996) carried out studies that employed cluster algorithms and obtained internal validation support for their respective job groupings. Cunningham and colleagues (Ballentine, Cunningham, & Wimpee, 1992; Cunningham, Boese, Neeb, & Pass, 1983; Pass & Cunningham, 1975; Riccobono, Cunningham, & Boese, 1975; Riccobono & Cunningham, 1974) have also

applied numerical classification techniques (both cluster analysis and factor analysis) and have repeatedly obtained stable job groupings.

The present study explored the potential usefulness of the O\*NET Domain descriptors as tools in job and occupational classification and in the development of a future numerical occupational classification system. More specifically, O\*NET numeric data were used to determine whether the descriptors could serve (a) as occupation-assignment tools within the existing SOC framework, (b) as a means of numerically generating a modified occupational classification structure, and (c) as estimators of O\*NET Job Zone requirements for occupations.

## **REVIEW OF THE LITERATURE**

This section begins with an overview of job classification systems, old and new, and proceeds with an in depth presentation and review of the Standard Occupational Classification (SOC) system. Next is an extensive review of the Occupational Information Network (O\*NET), which is now a SOC-based occupational classification scheme and vocational guidance tool, containing a host of valuable descriptive data. In addition, O\*NET's conversion to the SOC will be described. Following is a discussion of qualitative and quantitative approaches to job classification and research that has been carried out within each of these categories. This section will conclude with some commonly used quantitative procedures used to develop, empirically, numerical occupational taxonomies.

The need to group jobs was evident as early as the 1930s, when the United States Census classification and shortly thereafter the DOT were developed. These occupational taxonomies met economical and practical needs at the time. For example, the DOT was developed to address the matter of recording and tabulating job placements. Since then, other job classification schemes have been put forth for various purposes and to meet the specialized needs of those developing them. Kelley (1935) and Thurstone (1937) created taxonomies based on patterns of abilities required for job performance. In 1940, Humphreys developed a job classification system concerned with general functional aspects of jobs. This system allowed for the grouping of jobs based on the function performed regardless of the industry or establishment where the job occurred. These are just some age-old examples of the types of classifications researched and applied in fields, such as vocational guidance, counseling, and training.

In recent years, more current and widely used job classification systems have been developed. Various United States government agencies led the charge in the development of such systems for statistical reporting purposes. Examples are the Occupational Employment Statistics (OES) system, the Military Occupational Classification, the several revised versions of the DOT, O\*NET, and the SOC. It is important to mention that the United States is not the only country developing and using job classification systems. International examples are Canada's National Occupational Classification and the United Kingdom's International Standard Classification of Occupations (ISCO-88).

With so many classification systems in use today, it is no surprise that confusion exists; communication and data sharing between such systems is difficult and sometimes impossible. Recognizing this problem and responding to the need for a common classification structure, the United States Office of Management and Budget (OMB), some years ago, formed the SOC Revision Policy Committee and "...charged [them] with identifying the major statistical uses of occupational classifications, and creating a classification system that reflects the current occupational structure in the United States." (p. x; United States Department of Commerce, 2000). Upon completion of the newly revised SOC, the OMB mandated that all federal agencies collecting data on jobs and occupations use this system. It has also been suggested that states and local governments adopt this system, as well.

Converting to a new job classification system is a difficult, time consuming, and expensive task. States, for example, are reluctant to make the "switch" to the SOC after having used the DOT for decades. DOT codes are often embedded in computerized job

systems, which, if replaced, would, in some cases, require a complete overhaul of such systems. However, one state agency, the North Carolina Employment Security Commission/National Center for O\*NET Development (hereafter referred to as the O\*NET Center), has taken aggressive action and successfully converted O\*NET, which was originally an OES-based occupational system, to the SOC. In addition, the O\*NET Center has developed a “crosswalk,” or link, between the DOT and SOC codes, as well as valuable training materials and seminars to assist states, software developers, and other government agencies in planning and executing SOC conversion projects. Finally, many private companies (e.g., Eriiss, CE Technologies), quasi-governmental agencies (e.g., America’s Job Bank), and web-based job boards (e.g., Monster.com) have incorporated the SOC into their job systems. Monster.com, in particular, because of its international presence and recent partnership with the U.S. Department of Labor, has the capability of developing the world’s first global occupational classification system. As a first step towards that end, Monster.com is currently embedding the SOC into its database of over twenty million resumes. Once completed, the SOC will hopefully gain national and international recognition as a viable standard classification scheme for jobs.

### The Standard Occupational Classification (SOC)

As described in the SOC Manual,

The [SOC] is a system for classifying all occupations in the economy, including private, public, and military occupations.

This classification system replaces all occupational classification systems previously used by Federal statistical agencies.

It will be used by all Federal statistical agencies collecting occupational data, providing a means to compare occupational data across agencies. It is designed to cover all occupations in which work is performed for pay or profit, reflecting the current occupational structure in the United States (p. ix).

Various Federal government agencies contributed to the development of the SOC. Major players were the Bureau of Labor Statistics (BLS), Employment and Training Administration, and the Bureau of the Census.

The SOC contains 4 levels of aggregation within its hierarchy. The first and most general category is known as the Major Group level. There are 23 Major Groups in the SOC. Table 1 provides a listing of each of the Major Groups and their corresponding codes.

Table 1.

SOC Major Groups: Codes and Titles

<b>Code</b>	<b>Title</b>
11-0000	Management Occupations
13-0000	Business and Financial Operations Occupations
15-0000	Computer and Mathematical Occupations
17-0000	Architecture and Engineering Occupations
19-0000	Life, Physical, and Social Science Occupations
21-0000	Community and Social Services Occupations
23-0000	Legal Occupations
25-0000	Education, Training, and Library Occupations
27-0000	Arts, Design, Entertainment, Sports, & Media Occupations

<b>Code</b>	<b>Title</b>
29-0000	Healthcare Practitioner and Technical Occupations
31-0000	Healthcare Support Occupations
33-0000	Protective Service Occupations
35-0000	Food Preparation and Serving-Related Occupations
37-0000	Building and Grounds Cleaning and Maintenance Occupations
39-0000	Personal Care and Service Occupations
41-0000	Sales and Related Occupations
43-0000	Office and Administrative Support Occupations
45-0000	Farming, Fishing, and Forestry Occupations
47-0000	Construction and Extraction Occupations
49-0000	Installation, Maintenance, and Repair Occupations
51-0000	Production Occupations
53-0000	Transportation and Material Moving Occupations
55-0000	Military-Specific Occupations

As can be seen from the above Table, the Major Groups are extremely broad in scope. They had to be broad in order to capture all jobs in the economy and subsume three more levels of categorizations. Below the Major Group level are 96 Minor Groups, which are also fairly broad, but somewhat less so than the Major Groups. Three examples of Minor Groups are 11-1000 Top Executives, 19-1000 Life Scientists, and 41-2000 Retail Sales Workers. Note that the first two digits of the Minor Group code correspond to its “parent” Major Group. Hence, each of the forenamed Minor Group examples correspond to Major Groups, 11-0000 Management Occupations, 19-0000 Life, Physical, and Social Science Occupations, and 41-0000 Sales and Related Occupations, respectively.

The third level in the SOC hierarchy is known as the Broad Occupation. There are 449 Broad Occupations. In keeping with the aforementioned examples, some Broad Occupations are 11-1010 Chief Executives and 11-1020 General and Operations Managers (both grouped within Minor Group 11-1000 Top Executives); 19-1010 Agricultural and Food Scientists and 19-1020 Biological Scientists (both grouped within Minor Group 19-1000 Life Scientists); and 41-2010 Cashiers and 41-2020 Counter and Rental Clerks and Parts Salespersons (both grouped within Minor Group 41-2000 Sales and Related Occupations).

The fourth and most specific level in the SOC (yet still fairly broad) is the Detailed Occupation. Again, the code corresponding to each Detailed Occupation title is intuitive. The first two digits represent the Major Group, the third digit represents the Minor Group, the fourth and fifth digits denote the Broad occupation and the sixth digit denotes the Detailed Occupation. Completing the above three Major Group examples, corresponding Detailed Occupations are 11-1011 Chief Executives and 11-1021 General and Operations Managers; 19-1011 Animal Scientists, 19-1012 Food Scientists and Technologists, 19-1013 Soil and Plant Scientists, 19-1021 Biochemists and Biophysicists, 19-1022 Microbiologists, 19-1023 Zoologists and Wildlife Biologists, and 19-1029 Biological Scientists, All Other; 41-2011 Cashiers and 41-2012 Gaming Change Persons and Booth Cashiers, 41-2021 Counter and Rental Clerks, and 41-2022 Parts Salespersons. Table 2 on the following page provides a visual of the previous examples.

It is important to highlight the Detailed Occupation example, 19-1029 Biological Scientists, All Other. This is known as a residual category. It is a place to classify jobs that do not “fit” into any of the other related Detailed Occupation categories. Because of

the nature of these groupings (as “catch-all” categories), no data exists for these residual, Detailed Occupation, categories. Therefore the 73 All Other SOC residual categories were not used in this study. Data is also not available for occupations within the Major Group 55-0000 Military-Specific Occupations. Therefore all occupations within this Major Group were not included in this study.

Table 2.

SOC Hierarchy Examples

            **41-2021 Counter & Rental Clerks**  
            **41-2022 Parts Salespersons**

---

Note.

The occupations in bold are the Detailed Occupations for which data exists. It is data for occupations at this level that were used in this study.

The SOC, as evidenced by the above hierarchical coding scheme, is a complex and comprehensive system of occupations. If government agencies are to adopt this system and private developers wish to create SOC-based job software, the SOC must be clearly understood. In addition, if the SOC is to become the one standard classification system adhered to correctly by all, a set of rules must be followed during a classification effort. Thus, all those incorporating the SOC should do so in a similar manner. The SOC Policy Committee, for this reason, had developed a set of eight classification principles. Table 3 summarizes the eight principles.

Table 3.

Eight SOC Classification Principles

- 
1. The SOC covers occupations for which work is performed for pay. Therefore, volunteer workers are excluded from the SOC. Each occupation is assigned to one category at the lowest (most detailed) level in the SOC.
  2. Occupations are grouped based on work performed, skills, education, and training.
  3. Supervisors that have a background similar to those they supervise are categorized with those workers. Other workers that supervise, team lead, etc. that spend at least 20% of their time performing work like that of those they supervise are classified with those workers.
  4. First-line managers of production, sales, and service workers who spend more than 80% of their time performing supervisory activities are grouped separately in the appropriate supervisor or management category.
  5. “Apprentices and trainees are classified with the occupations for which they are being trained, while helpers and aides are classified separately” (p. xii).
  6. If an occupation could not be included as a Detailed Occupation, it was therefore classified in the appropriate Residual Occupation.
  7. Should it be possible that a worker be classified in more than one SOC category, they should be placed with the Detailed Occupation requiring the higher skill level.
  8. Those using the SOC to group jobs or occupations should do so at the most detailed level possible.

Note.

All classification principles included in Table 3 have been paraphrased from those contained in the SOC Manual (p.p. xii-xiii). Principle 5 has been quoted word-for-word.

Few studies, if any, have conducted empirical testing of the judgmentally developed SOC. This may have been because there have not been any publicly available, numeric data associated with the various SOC categories. The SOC is simply a descriptive, organizational structure that can be used to group occupations, jobs, positions, and the like. It contains a system of codes and occupational titles, and at the Detailed Occupation level, brief descriptions of each occupation are provided. The present study is the first to conduct empirical classification within the hierarchical framework of the SOC. This study has been made possible due to the recent conversion of what is known as the O\*NET, a system of occupations with associated descriptive data, to the SOC. O\*NET's domain-specific, descriptor data now describes nearly all of the SOC's Detailed Occupations. Following is a discussion of O\*NET and the specific descriptor domains relevant to this research. In a later section, O\*NET's conversion to the SOC will be described in detail.

### The Occupational Information Network (O\*NET)

#### O\*NET Beginnings

O\*NET is the United States Department of Labor's (U.S. DOL) replacement for the DOT. The DOT, first published in 1939, was the result of thousands of job analyses and contained occupational categories that have been used for years to classify over 15,000 jobs. There had been numerous revisions of the DOT, the last and most recent having been in 1991. In this version, information is provided for over 12,000 occupations (U.S. DOL, 1991). Over the years, some important uses of the DOT have been as a tool for person-job matching, hiring, vocational placement, and training (Dunnette, 1999). The

DOT has also been used extensively by nearly every state's employment service to assign codes to applicants and employees. As years passed and more sophisticated methods for conducting job analyses came about (Brannick & Levine, 2002; Ash, 1988; Levine, 1983), the time and expense of updating the DOT became a problem. Dunnette (1999) stated, “[r]apid changes in technology and patterns of employment have resulted in serious delays in keeping the DOT updated. Accordingly large portions of the information are out of date at any given time” (p. 4).

Because of the problems associated with maintaining and updating the DOT, the U.S. DOL formed the Advisory Panel for the DOT (APDOT). The panel was charged with defining, producing, publishing, and disseminating a new DOT and recommending continuous improvements. The APDOT soon came forth with its recommendations for a new occupational information system that would meet the needs of a 21<sup>st</sup> Century workforce. According to the APDOT, this new system should

...promote the effective education, training, counseling, and employment of the American Work Force. The DOT should be restructured to accomplish its purpose by providing a database system that identifies, defines, classifies, and describes occupations in the economy in an accessible and flexible manner.

Moreover, the DOT should serve as a national benchmark that provides a common language for all users of occupational information. (U.S. DOL, 1993, p. 6).

Hence, O\*NET was born. It was in January of 1995 that the term Occupational Information Network was first used to describe the newly proposed system that would

soon be developed (Dye & Silver, 1999). Dye & Silver described O\*NET as a database “...that uses a common language for collecting, describing, and presenting valid, reliable occupational information about work and the worker...O\*NET is [also] an informational hub for language and data, enabling labor exchange members to communicate with each other” (p. 9). Once completed, O\*NET would serve as the nation’s main (automated) source of occupational information.

### The O\*NET Content Model

In order to fulfill one of O\*NET’s primary missions (i.e., to serve as a common language for work and worker characteristics), an underlying, conceptual model was developed. Initially the APDOT put forth a conceptual model that described the world of work and would serve as a precursor to the final O\*NET Content Model. This initial model was simplistic in design, containing four broad domain areas: Worker Attributes, Work Context, Labor Market Context, and Work Content and Outcomes. A visual of the model is presented in Figure 2 on the following page. The final O\*NET Content Model is a descriptive, exhaustive framework covering areas ranging from Worker Requirements (including skills and knowledge) to Worker Characteristics (including abilities and interests) to Occupational Requirements (including generalized work activities to work context) to Occupation Characteristics (including labor market information and wages). The final Content Model was presented previously in the Introduction in Figure 1.

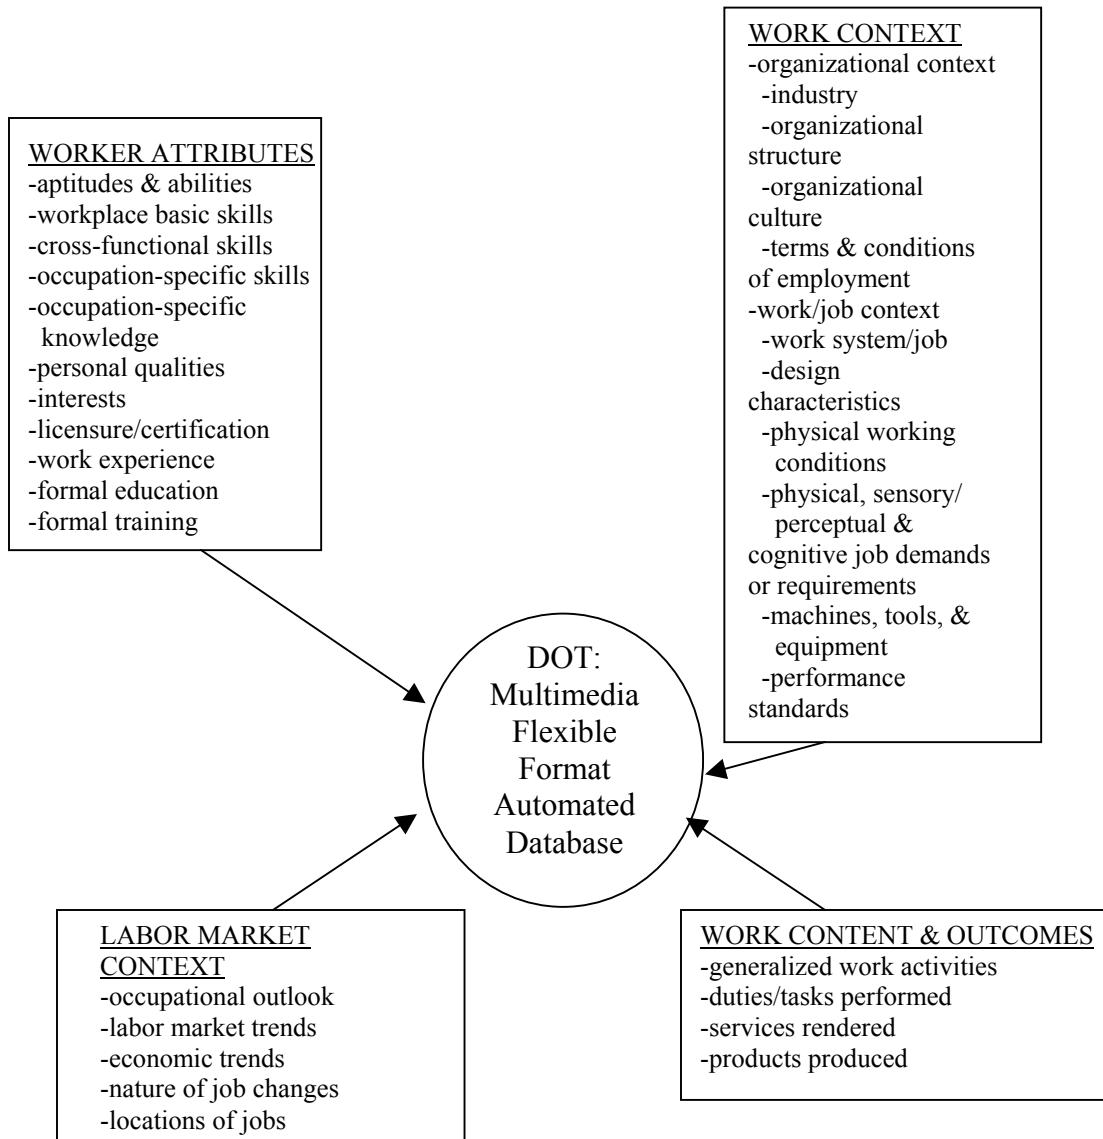

### O\*NET Descriptor Domains

O\*NET was designed such that jobs and occupations could be described in terms of what Cunningham (1996) refers to as “nomothetic” variables (or descriptors). These

types of broad descriptors would allow for a cross-job approach and therefore cross-job comparisons (Mumford & Peterson, 1999). O\*NET was also based on a “multiple windows” approach allowing occupations to “...be described and understood from a number of different perspectives” (Mumford & Peterson, 1999, p. 23). Therefore, in line

Figure 2.

The APDOT Content Model: Precursor to the O\*NET Content Model

with this approach, several descriptor domains were developed that described both the occupation and the worker.

Worker-oriented domains for which data are available include Skills, Abilities, Work Styles, Work Values, and Interests. Data are also available for occupation-oriented domains such as Knowledge, Generalized Work Activities, Work Context, and Occupational Tasks. Other domains exist as part of the Content Model for which neither respective questionnaires nor data are available in O\*NET. Examples are Organizational Context, Occupational Skills, and Machines, Tools, and Equipment. The Content Model presented in Figure 1 highlights all conceptual descriptor domains included in O\*NET. For an exhaustive discussion of the research and development of the domains contained in O\*NET, the reader is referred to *An Occupational Information Network for the 21<sup>st</sup> Century: The Development of O\*NET* (Peterson, Mumford, Borman, Jeanneret, & Fleishman, 1999). The present study focused on four of the O\*NET domains: Knowledge, Skills, Abilities, and Generalized Work Activities. It is data from each of these descriptor domains that were used in this study. Each is described in detail below.

Knowledge. Costanza, Fleishman, & Marshall-Mies (1999) defined job-related knowledges as "...those facts and [organized cognitive] structures that are necessary for successful job performance" (p. 71). Defining job-relevant knowledge was the first step in the development of a knowledge taxonomy that could span a wide range of occupations. Early research led Costanza, et al. to the F-JAS (Fleishman, 1992), which contained many work-related knowledge areas. As well, the authors reviewed DOT job descriptions to glean knowledge requirements for thousands of jobs. After extensive research and review, a knowledge-requirements taxonomy was developed. Seven general

knowledge categories, including Artistic/Creative, Business/Administrative, Mechanical/Skilled Trades, Outdoor Work, Professional, Scientific, and Service Sector, were initially identified. In addition, 86 individual knowledges, including examples such as Art, Chemistry, Math, and Computers, were also identified. The second revision resulted in 49 knowledge statements. Since the goal was to develop a “parsimonious set of knowledges classified into broader clusters,” the list was reduced yet again. The final set of 33 knowledges includes examples such as knowledge of Computers and Electronics, Food Production, Geography, and Law.

Reliability testing was performed on the final set of knowledge-requirement statements (Costanza, Fleishman, & Marshall-Mies, 1999). A sample of 645 job incumbents rated 32 occupations using the statements. High interrater agreement was found between raters and across occupations (reliabilities for level and importance were found to be in the 80s). In addition, the underlying dimensionality of the knowledges was explored, using principal components analysis applied to level data. Seven components emerged that were clear and interpretable and accounted for 84% of the variance.

Skills. Mumford, Peterson, & Childs (1999) were charged with developing a taxonomy of skills applicable to a wide range of jobs. After much research into the domain of workplace behavior (Mumford & Peterson, 1995), two types of skills were proposed: (a) Basic Skills, which include Content Skills and Process Skills and (b) Cross-functional Skills, which include Problem Solving Skills, Social Skills, Technical Skills, Systems Skills, and Resource Management Skills. In the development of basic content skills, Mumford & Peterson (1995) argued, “...learning is intimately tied to the

acquisition and application of knowledge. Thus, basic content skills can be defined in terms of those capabilities that allow people to acquire information and convey this information to others” (Mumford, Peterson, & Childs, 1999; p. 51). Basic process skills, on the other hand, are skills that involve the worker taking a more active role in acquiring and applying knowledge. These also involve general strategies, processes, and procedures that contribute to learning (Mumford, Baughman, Supinski, Costanza, & Threlfall, 1996). Some examples of O\*NET’s basic skills are Reading, Writing, and Listening.

Cross-functional skills can be considered general skills applicable across a wide-range of jobs. For example, problem solving is an important, performance-relevant activity that is typically required for nearly all jobs. In support of the final proposed skills taxonomy, it was found that Fine’s (1988) taxonomy of data, people, and things mapped well to O\*NET’s final set of cross-functional skills. Examples of cross-functional skills are Problem Identification, Solution Appraisal, Technology Design, Troubleshooting, and Visioning.

Abilities. The O\*NET ability-requirements taxonomy contains 52 abilities applicable to a wide range of jobs. The Fleishman Job Analysis Scales (F-JAS; Fleishman, 1992) served as the foundation for the O\*NET taxonomy. The Fleishman abilities have been researched for more than 40 years and have a long history of use in government and the military. This research has provided evidence for scale reliability (Hogan, Ogden, & Fleishman, 1978; Myers, Jennings, & Fleishman, 1981; Driskill & Dittmar, 1993), support for internal validity (Hogan, Ogden, & Fleishman, 1979; Fleishman & Mumford,

1988; Landy, 1988), and external validation support (Zedeck, 1975; Fleishman & Mumford, 1991).

The F-JAS was modified somewhat to meet the purposes of O\*NET. For example, certain items were not used in O\*NET, and text (showing how a certain ability was different from other abilities) that preceded each ability scale was eliminated. Also, behavioral anchors, deemed potentially insensitive (to certain cultural groups) were replaced with new ones. The new anchors were empirically scaled (Fleishman, Costanza, & Marshall-Mies, 1999). The O\*NET abilities taxonomy now contains various abilities, ranging from Verbal abilities (including Oral Comprehension and Written Expression) to Reasoning abilities (including Deductive and Inductive Reasoning) to Quantitative Abilities (including Number Facility and Mathematical Reasoning) to Physical Strength abilities (including Explosive Strength and Static Strength; see Figure 3).

Generalized Work Activities (GWA). Cunningham (1974) described structured job analysis as a “nomothetic” process, which can be considered “...an approach emphasizing the common dimensions rather than the unique characteristics of tasks, jobs, and occupations” (p. 8). It is this approach that served as the foundation for the development of the GWA taxonomy. In addition, Jeanneret, Borman, Kubisiak, & Hanson (1999), the authors responsible for developing the GWA taxonomy, reviewed four nomothetic questionnaires. They were the Position Analysis Questionnaire (McCormick, Jeanneret, & Mecham, 1969), the Occupation Analysis Inventory (Cunningham, 1988), the General Work Inventory (Cunningham, Wimpee, & Ballantine, 1990), and the Job Element Inventory (Cornelius, Hakel, & Sackett, 1979). Many factor

analyses carried out over the years using these questionnaires have provided some insight into the structure underlying work.

After an extensive review of various factor structures (i.e., underlying work dimensions), Jeanneret, et al. (1999), developed 42 General Work Activity statements that subsequently became part of the O\*NET GWA questionnaire. Examples are Getting Information Needed to do the Job, Processing Information, Handling and Moving Objects, and Resolving Conflicts and Negotiating with Others. The original GWA questionnaire was different than the other three domain questionnaires in that a frequency scale was included. Recently, all O\*NET questionnaires have been revised, and the frequency scale was dropped.

Interrater agreement studies were carried out for the GWA scales (Jeanneret, et al., 1999), and coefficients were repeatedly found to be in the 70s and 80s. In one study, the interrater reliabilities for the level scale were found to be in the 90s. A principle components analysis was carried out, as well, using level data. A three-component solution was found that accounted for 71% of the variance. Jeanneret, et al. stated, “the communalities suggested that for the most part the GWA dimensions are well-represented with this [three-factor] solution” (p. 121). Three components were named: Working With Information, Working With and Directing the Activities of Others, and Manual and Physical Activities.

### O\*NET Classification Issues

The occupations contained in O\*NET had to be organized (or classified) such that the various users (e.g., government agencies) could communicate and share data across their existing systems. During O\*NET’s development, one of the few available national

occupational classification systems used by government reporting agencies, such as the U.S. Census and the BLS, was the Occupational Employment Statistics (OES) system. The SOC was available and considered, but was still in development, was neither conceptually nor technically compatible with the OES, and therefore, at the time, was not chosen as the classification system for O\*NET. Because of the lack of one, best classification and coding system, it was decided that O\*NET would use the OES system. The OES system, first introduced in 1983, used a five-digit coding system and described over 700 occupations. The O\*NET system contained over 1,000 occupations, and therefore the OES had to be slightly modified to incorporate the additional O\*NET occupations.

Not too long after the release of the first public version of the OES-based O\*NET, O\*NET 98, the BLS had revised and completed the SOC (U.S. DOL\BLS, 1999). The OMB then mandated that all government agencies collecting data on jobs and occupations adopt the SOC. O\*NET quickly adhered to this mandate, and in 1998 began its transition. In 1999, the conversion of O\*NET to the SOC was completed.

### O\*NET's Conversion to The SOC

The O\*NET Center, funded by the U.S. DOL, engaged in a lengthy effort to classify its occupations (and all associated data) into the SOC framework. Adhering to the classification principles (see Table 3) was an important objective of the conversion project. Classification principle 8 states that those using the SOC to classify occupations should do so at the most detailed level possible. O\*NET adhered to this principle by aligning most of its 1,122 occupations to SOC Detailed Occupations (Levine,

Nottingham, Paige, & Lewis, 1999). Those O\*NET occupations that did not align well with SOC Detailed Occupations were dropped and are not available in the new system. The new SOC-based O\*NET system is now known as the O\*NET-SOC system.

### Overview of the O\*NET-SOC System

The new coding system used the six-digit SOC codes and attached a two-digit suffix (e.g., .00, .01-.50, .51-.99) to the existing SOC codes. The new codes serve two purposes: (a) they allow the user to operate in SOC mode and (b) they allow the user to continue to attain the level of detail offered by O\*NET beyond that of the SOC. A goal of the new system was to be flexible, which readily allows the addition of new information (e.g., new occupations). In addition to the institution of a new coding system, other important efforts were undertaken by the O\*NET Center to support the O\*NET-SOC conversion project. These efforts were as follows: (1) Where possible, O\*NET titles and brief descriptions were converted entirely to SOC titles and definitions, (2) Current and future O\*NET data collections will use SOC titles and definitions, when possible, and (3) A new database using the SOC-based coding and classification structure was developed. This database will serve as the foundation for all future O\*NET efforts, for example, *O\*NET OnLine* (Levine, Nottingham, Paige, & Lewis, 1999).

### The O\*NET-SOC Coding System

This section, due to the complexity and detailed nature of the coding conversion, has been excerpted from my own work, the document, *Transitioning O\*NET to the Standard Occupational Classification* (Levine, Nottingham, Paige, & Lewis, 1999). Wording, in some cases, has been slightly modified to reflect the objectives of the current study.

For purposes of the upcoming discussion, it is important to note that SOC occupations will be referred to as SOCs and O\*NET occupations as OUs. Following is a presentation of the overarching principles of the new classification and coding system, as well as a description of the coding system for four different occupational linkage examples. They are (1) one SOC to one OU, (2) one SOC to many OUs, (3) many SOCs to one OU, and (4) SOC does not link to an OU.

The overarching principles that guided the O\*NET conversion effort are summarized as bullet points below. The principle is highlighted in bold and below each is a brief description.

- **The extension “.00” denotes a specific SOC occupation**

A .00 was added to the six-digit SOC code for a given occupation to allow users to know which O\*NET-SOC occupations are the same as SOC occupations. In most cases, data is available for these occupations.

- **The extensions “.01, .02,... .50” denote occupations derived from O\*NET**

These extensions are used (a) when the system must retain the O\*NET title and definition and (b) when there is greater level of detail in O\*NET than in the SOC. Sometimes the extension .01 is used when only one O\*NET OU is linked to an SOC, but is more detailed than the SOC. In most cases, however, these extensions are used when there is more than one OU linked to a single SOC. Currently, data are available for occupations having these extensions.

- **The entire SOC structure has been incorporated into the O\*NET database**

The SOC structure, including Major Groups, have been included in the newly released O\*NET database. This will hopefully facilitate the use of the entire SOC hierarchy.

- **“All Other” (residual) SOC categories will not be used in future data collection efforts**

Since the goal of the O\*NET-SOC is to adhere to the SOC and collect data on only SOC occupations in the future, data will not be collected on O\*NET occupations matched to residual categories. Therefore, these occupations were not included in this study.

- **Special cases**

Two O\*NET occupations initially linked to “All Other” SOCs were selected to be retained in O\*NET-SOC. They are Human Resources Managers and Biologists. These OUs were classified with the appropriate SOC Broad Occupation.

Using the overarching principles as guiding rules, the conversion effort was carried out. During the transition from O\*NET to the SOC, several occupational linkage situations became possible. Following is a numbered description of these coding system (and linkage) situations and specific examples that correspond to those mentioned previously (one SOC to one OU, one SOC to many OUs, many SOCs to one OU, and SOC does not link to an OU).

**1. One SOC to One OU** (482 cases) – In a one-to-one relationship, there is simply one OU linked to the corresponding SOC occupation. Table 4 below provides an example.

Table 4.

Example of the One SOC to One OU Linkage Situation

SOC Occupation	O*NET OU	O*NET-SOC Occupation
13-2053 Insurance Underwriters	22102 Underwriters	13-2053.00 Insurance Underwriters

Note.

In this example, the OU title (and definition) was determined to be similar enough to the SOC title (and definition) that the SOC could replace the OU. Therefore the two-digit extension .00 was added to the SOC code, resulting in the new O\*NET-SOC occupation.

**2. One SOC to Many OUs** (120 SOCs with added O\*NET detail below, resulting in 343 cases) – In this situation, O\*NET OUs were at a finer level of detail than the SOC occupation. Therefore the extensions, .01, .02, etc., were used to denote this greater level of detail. Two types of examples of this linkage situation are provided in Table 5 below.

Table 5.

Two Examples of the One SOC to Many OUs Linkage Situation

Example 1.		
SOC Occupation	O*NET OU	O*NET-SOC Occupation
19-1031 Conservation Scientists	24302B Soil Conservationists 24302D Range Managers 24302E Park Naturalists	19-1031.00 Conservation Scientists 19-1031.01 Soil Conservationists 19-1031.02 Range Managers 19-1031.03 Park Naturalists

Example 2.		
<b>SOC Occupation</b>	<b>O*NET OU</b>	<b>O*NET-SOC Occupation</b>
19-1013 Soil and Plant Scientists	24305B Plant Scientists 24305D Soil Scientists	19-1013.00 Soil and Plant Scientists 19-1013.01 Plant Scientists 19-1013.02 Soil Scientists

Notes.

In the first example, the extensions .01, .02, .03 were assigned to the more detailed OUs linked to this SOC occupation. In addition, the extension .00 was assigned to the occupation, Conservation Scientists, to show that it was retained in the O\*NET-SOC system at the SOC level. Data is available for the three, more detailed occupations, Soil Conservationists, Range Managers, and Park Naturalists.

In the second example, the SOC occupation is a “roll-up” of the two more detailed OUs. Therefore a .00 was assigned to the SOC occupation to show that it is now part of the O\*NET-SOC system. The extensions, .01 and .02 were assigned to show that the OUs, Plant Scientists and Soil Scientists, were a more detailed, breakout of the SOC occupation. Data are available for these more detailed occupations.

**3. Many SOCs to One OU** (30 broader OUs, leading to 75 cases) – In this situation, the SOC had a greater level of detail than the OU. Therefore the same O\*NET data was used to describe each of the SOCs to which the OU had been linked. It is important to note that for the purposes of the current study, only one of the many SOC occupations linked to a single OU will be selected and included, since the data is the same. Table 6 below provides an example of this situation.

Table 6.

Example of the Many SOCs to One OU Linkage Situation

<b>SOC Occupation</b>	<b>O*NET OU</b>	<b>O*NET-SOC Occupation</b>
13-2071 Loan Counselors	21108 Loan Officers and Counselors	13-2071.00 Loan Counselors
13-2072 Loan Officers		13-2072.00 Loan Officers

Note.

In this example, the SOC occupations were a breakout of the broader OU. Currently, data is available for only Loan Officers and Counselors combined. In the future, data will be collected separately for the new O\*NET-SOC occupations.

**4. Detailed SOC does not match to an OU** (74 cases) – Sometimes there are no OUs linked to a particular SOC. These occupations were assigned an SOC code with a .00 extension. Data is not available for these SOC occupations, and therefore they will not be included in this study. Table 7 provides an example of a SOC that does not have a corresponding OU match.

Table 7.

Example of the Detailed SOC does not match to an OU Situation

SOC Occupation	O*NET OU	O*NET-SOC Occupation
11-1031 Legislators	None	11-1031.00 Legislators

Note.

The extension .00 was added to the SOC code to show that this occupation is now included as part of the new O\*NET-SOC system. Data will be collected on this occupation in the future.

**5. Temporary Codes for Occupational Code Requests (OCR)** – OCRs are instances where the public may request that a new occupation not currently part of the O\*NET-SOC system be added. These new occupations are assigned a temporary code and title and may one day become a permanent occupation in the system. Extensions .51-.99 have been reserved for new occupation requests and will be assigned accordingly.

It can be seen from the above linkage examples that the conversion effort was a complex and large-scale project. Approximately 1,122 O\*NET OUs were matched to 821 SOC occupations, resulting in the new O\*NET-SOC system, which contains 1,094 occupations. Of the 1,094, data is available for 974. A subset of the 974 occupations was included in the present research. For example, the SOC contains various military classifications for which no data is available. Therefore military occupations were not used in the current study. In addition, some of the above coding system situations (#3

and #4) discuss when certain SOC occupations will not be included. The upcoming Research Methods section discusses which SOC occupations were and were not used in this study. A comprehensive spreadsheet containing every SOC and O\*NET occupation and linkage situation is available in Levine, Nottingham, Paige, & Lewis (1999).

It is important to mention that while every care was taken to assure that classifications during the conversion effort were made correctly, all decisions were based on the judgments of a few trained O\*NET Center personnel. Because of the success of the newly released O\*NET-SOC system and acceptance by various government agencies, it appears that the qualitative approach taken to occupational classification has proved useful thus far.

### Qualitative and Quantitative Classification

The SOC hierarchy was developed using rational means. O\*NET was the result of both quantitative (cluster analyses of the DOT were carried out) and qualitative classification techniques. The aforementioned O\*NET conversion project was a judgmental undertaking. Bailey (1994) mentions that such judgmental efforts tend to be more conceptual than empirical, since they are not based on numerical approaches (i.e., mathematical algorithms). Qualitative job classification methods, however, are common and have been the primary means by which nearly all government classifications in use today have been created. Pearlman (1980) supported this notion by discussing that government agencies most often use rational processes to develop job classification systems.

Henderson (1988) described a qualitative classification approach to determine pay rates for positions. In this study, participants reviewed job descriptions and narratives of pay rates. Participants then sorted jobs into the previously determined pay categories. Whether or not this rational procedure yielded valid results was impossible to assess due to the lack of empirical testing. This demonstrated that, in this case, a rational approach suffers a distinct disadvantage to that of an empirical procedure. Fleishman & Quaintance (1984) discussed a rational classification procedure in which job descriptor information was reviewed and determined to be either present or absent from each case. Cases were then judgmentally grouped based on either one or more attributes, which assisted participants in determining group membership. Sackett, Cornelius, & Carron (1981) also demonstrated that a qualitative approach to job classification using global judgments produced useful results.

Harvey (1990) did not particularly care for judgmental (or holistic) approaches to classification and believes results are unacceptable when empirical methods are not employed. Fortunately, there has been a host of research that have employed quantitative (empirical) approaches to job classification.

Probably the most comprehensive, quantitative classification study to date was the research series carried out by Cunningham and colleagues (Pass & Cunningham, 1975; Riccobono, Cunningham, & Boese, 1975; Cunningham, 1974; Cunningham, Tuttle, Floyd, & Bates, 1974). The research began with the development of the Occupation Analysis Inventory (OAI). The instrument contains 622 work activity descriptors used to rate jobs or occupations (Cunningham et al., 1974). The OAI "...represented an attempt to achieve as much specificity (or content loading) in occupational descriptions as

possible, while retaining applicability to the entire occupational spectrum” (Pass & Cunningham, 1975; p. 1). It was the intent of these researchers at the time to develop a comprehensive, numerical taxonomic system for “...describing, comparing, and grouping jobs and occupations” (p. 3). Subsequently, several quantitative studies were carried out employing the OAI.

Riccobono et al., (1975) applied a cluster algorithm to 814 job based on factor score profile similarities for 22 OAI dimensions. Seventy-three clusters were identified. Pass & Cunningham (1975) followed shortly after and derived occupational clusters from 1,414 jobs rated on all 622 OAI items. Several factor analyses and hierarchical cluster analyses were carried out. Factor analyses resulted in 132 first-order work dimensions and 28 higher-order work dimensions. Hierarchical cluster analyses were then employed using factor score profiles as variables, resulting in 21 broad clusters and 88 narrower clusters, which were subsumed under the broad clusters. Statistical tests revealed that the final broad cluster solution was meaningful and stable. Pass & Cunningham (1975) suggested that the resultant cluster solution might provide a viable taxonomic schema for occupational guidance and related educational purposes.

Hamer & Cunningham (1981) used 50 jobs rated on OAI items. Factor analyses were carried out and resultant factor scores became the profile data used in subsequent hierarchical cluster procedures. In this study, the authors compared seven different profile association measures for their effectiveness in clustering data. They found that the correlation and cosine performed better than distance and overlap measures. They stated, “[t]he results demonstrate the importance of the choice of a profile association measure in cluster analysis” (p. 63). Finally, Ballentine, Wimpee, & Cunningham (1992)

conducted a numerical classification study using 180 (Air Force) job incumbents' General Work Inventory ratings on their positions. Hierarchical cluster analyses resulted in 21 stable and meaningful job clusters.

While it does appear that Cunningham and colleagues have dominated the "quantitative clustering space," others have carried out research within this realm, as well. Dowell & Wexley (1978) developed a supervisor task description questionnaire (STDQ) containing 100 work activities. A sample of 251 plant supervisors rated their jobs on STDQ items. A factor analysis of the responses yielded seven meaningful job dimensions. Cullen (1991) was concerned with the nature of "professionalism." He performed a hierarchical cluster analysis on 203 professional occupations using data from the DOT. Three occupational clusters resulted: (1) a medical cluster, (2) an accepted profession cluster, containing occupations such as accountant, computer programmer, and architect, typically employed by formal organizations, and (3) a "least-professional" cluster, containing occupations such as bank teller and secretary. Finally, Converse & Oswald (2000) compared cluster analyses for three different types of General Aptitude Test Battery data. A multi-approach to clustering the data was employed to "...avoid the potential problems associated with any one method" (p. 7), including Ward's (1963) hierarchical method, a Q-type factor analysis, and a hybrid technique. They found that each of the three types of data (actual profile data, regression-estimated profile data, and field analyst rated data) resulted in dissimilar job clusters.

Cunningham (1996) pointed out that there has been a trend toward what he referred to as "numerical taxonomy." As is evidenced from the above quantitative research, he appears to have been correct. More specifically defined, numerical (occupational)

taxonomy is a quantitative approach to job classification, whereby a mathematical algorithm is applied to numeric data in order to derive clusters of jobs. Cluster analysis is one such numerical classification method that has been frequently used to derive empirically-based job taxonomies.

### Some Occupational Grouping Procedures

Cluster analysis is a quantitative technique that has been used for years to classify people or things. Early work in the natural sciences, such as anthropology and biology, employed cluster analysis to create taxonomies. Attempts by scientists, such as Thorndike (1953), were made to apply a more scientific and objective approach to numerical classification and in fields other than the natural sciences. Years ago, clustering was very difficult to do without computers (Bailey, 1994). Today cluster analysis techniques are computerized and clustering can be carried out in minutes.

“Cluster analysis techniques may themselves be ‘classified’ into types... These types are not necessarily mutually exclusive, and several clustering techniques could be placed in more than one category” (Everitt, 1974; p. 7-8). Everitt describes some “rough” categories, such as hierarchical techniques and overlapping or clumping techniques. Following is a discussion of two hierarchical clustering techniques commonly used within the domain of job classification. They are Ward’s (1963) method and a hybrid approach that combines Q-type factor analysis and Ward’s method (Colihan & Burger, 1995; Harvey, 1986).

Ward’s Method. Ward (1963) suggested a procedure to form hierarchical groups of mutually exclusive subsets, whereby members within each subset are as similar as possible; Overlapping cluster membership is not permitted. This procedure is useful in

that it takes into account group member similarity “...with respect to many variables” (p. 236). Ward’s intent was to form each number of groups,  $n$ ,  $n-1$ , ..., 1, in a way that would “minimize the loss associated with each grouping”, and to quantify the loss so it may be interpreted. Therefore, Ward proposed “...(a) to reduce the number of groups from  $n$  to  $n-1$  in a manner that would minimize loss and then, without modifying the groups formed, repeat the process until the number of groups was systematically reduced from  $n$  to 1, if desired, and (b) to evaluate loss in terms of whatever functional relation best expressed an investigator’s criterion for grouping” (p. 236).

One assumption underlying this approach is that the greatest amount of information is available when members are ungrouped. Ward’s hierarchical procedure begins with these  $n$  members. His hierarchical grouping procedure is described below.

The first step in grouping is to select two of the  $n$  [members], which, when united, will reduce by one, the number of [members] while producing the least impairment of the optimal value of the objective function. The  $n-1$  resulting [members] then are examined to determine if a third member should be united with the first pair or another pairing made in order to secure the optimal value of [an] objective function for  $n-2$  [members]. This procedure can be continued until all members of the original array are in one group (p. 238).

This cluster technique has been computerized and is available in the SAS/STAT software (SAS Institute, 1990). In order to implement this procedure in SAS, the Method = Ward statement must be specified. According to the SAS Institute, the distance

between two clusters using Ward's method is the ANOVA sum of squares between the two clusters summed across all variables.

The Hybrid Approach. The hybrid approach used by Harvey (1986), Colihan & Burger (1995), and Kubisiak (2002) combines Q-type factor analysis and cluster analysis. Q-type factor analysis is an approach that differs from Ward's method, because it allows overlapping cluster members. It is considered a grouping technique, because it is different than the typical R-type factor analysis. An R-type analysis groups variables based on correlations between a set of observations. Q-type analysis differs from R-type in that the cases (not variables) are correlated and factor analyzed. For example, in a matrix whereby occupations are the rows, abilities are columns, and cell entries are mean ability ratings, the occupations can be intercorrelated and the resulting occupation-by-occupation matrix factor analyzed to produce "groupings" or dimensions of occupations. Colihan & Burger (1995) described an applied example of Q-type analysis:

In a Q-type factor analysis applied to job classification, each job is represented by a profile of ratings across a set of job analysis items. A similarity index (e.g., correlation) between each pair of jobs is then computed, and the resulting job-by-job similarity matrix is factor analyzed to find groups of jobs with similar profiles across the job analysis items (p. 566).

Q-type factor analysis can be implemented in SAS by first correlating cases (i.e., rows) and then utilizing the Factor or Princomp procedure. SAS does not distinguish between Q-type and R-type analysis. It is up to the user to specify whether it is the rows or columns that are to be intercorrelated.

Harvey (1986) and Colihan & Burger (1995) described that once the Q-factor analysis is complete, a cluster analysis is carried out on the Q-factor results. Colihan & Burger's approach can be applied to occupations. First, an occupation-by-occupation matrix is factor analyzed. Second, the resulting factor structure would then be used to form a new occupation-by-occupation similarity matrix. Finally, this new similarity matrix is cluster analyzed using a selected clustering technique to classify occupations. This approach can be implemented in SAS by first implementing the Factor or Princomp procedure and then subsequently any chosen hierarchical method, for example, method = Ward.

#### Advantages and Disadvantages of the Two Clustering Methods

A disadvantage of Ward's method is that it forces an "independent cluster solution" on the data. Applied to job classification, Colihan & Burger (1995) stated that a job would be grouped into only one job cluster; therefore, overlap between job families is ignored. Harvey (1986; 1991) declared that "...[the] independent-clusters model presents an unlikely description of most 'true' job structures." (Colihan & Burger, 1995; p. 566).

According to Levine (1983), there are various levels of job analysis that can be considered rungs on a "job analysis ladder." At the lower end of this ladder, more distinct units of analysis exist, such as elements, tasks, and positions. As we climb higher up the ladder, rungs (e.g., jobs, job families, occupations, occupational families) become more ambiguous, having no clear-cut boundaries between them. Therefore, when clustering occupations or jobs, it may be more appropriate to use clustering techniques that allow overlapping clusters. A more acceptable occupational structure might contain occupations that share similar competencies (i.e., knowledge, skills, and abilities). The

hybrid approach (including Q-type factor analysis) approach thus offer this advantage over Ward's method, in that it allows for overlapping clusters.

Gandy (1979) also suggested that Q-type analysis has some advantages over common hierarchical techniques for job classification, because Q-type analysis clusters members based on error-reduced space, "making it potentially more robust to measurement error than cluster analysis" (Colihan & Burger, 1995; p. 567). They further stated that "...cluster analyses can often be unstable because the first step of each new grouping depends on only two or three profiles. Q-type factor analysis relies on the entire set of relationships within the sample in forming clusters" (p. 567). Overall, Colihan & Burger found that hybrid techniques and Q-type factor analysis were superior to more traditional, hierarchical clustering techniques. However, Ward's method did reasonably well when the "correct" number of job families was specified at the outset. When the correct number of occupational clusters is unknown (as is probably the case in reality), Q-factor analysis or the hybrid approach may be advantageous.

Riccobono, Cunningham, & Boese (1975) described some clustering methods and discussed advantages and disadvantages. In contrast to Colihan & Burger (1995), Harvey (1986), and Gandy (1979), Riccobono et al. argued that a shortcoming of the Q-type factor analysis method is that it does not identify boundaries of clusters. Therefore, a grouping problem occurs when an occupation, for example, has high loadings on more than one factor. They further purport two advantages of Ward's method over Q-factor analysis. First, this technique "...provides a complete hierarchical structuring, with the number of possible solutions ranging from two groups to the total number of objects in the sample, [therefore, making it] unnecessary to specify the number of clusters in

advance.” Second, it provides an error index at each grouping stage that can assist the researcher in determining the final number of clusters to retain (p. 18). After an extensive comparison of clustering methods, the conclusion reached by Riccobono et al. was that hierarchical methods (e.g., Ward’s) are superior to Q-type factor analysis.

Kubisiak (2002) also compared the hybrid approach to Ward’s method. This study is particularly relevant to the present research in that the same O\*NET data set is used. Kubisiak found, after an extensive comparison of cluster solutions resulting from each of the methods, that Ward’s method repeatedly yielded more homogeneous and stable cluster solutions. Based on Kubisiak’s results and previous comparative taxonomic research, Ward’s method was employed in the present study.

## PURPOSE

The proposed study involved an exploration in numerical occupational classification. The results helped determine whether four selected sets of O\*NET domain descriptors (knowledge, skills, abilities, and generalized work activities) could be integrated into the existing SOC classification system. This was accomplished by testing the potential usefulness of the descriptors (a) as assignment tools within the existing SOC framework, (b) in numerically generating a modified classification structure consisting of occupational groupings that are homogeneous in their human requirements, and (c) as tools in estimating O\*NET Job Zones (i.e., education/experience/training requirements) for occupations.

## **RESEARCH METHODS**

### *Dataset*

The O\*NET dataset is a comprehensive database containing analyst ratings of over 1,000 occupational units (OUs). However, during O\*NET's conversion to the SOC, several of the original 1,122 OUs were dropped, leaving 974 occupations. Some caveats relevant to the data used in the present study must be mentioned. First, only 900 of the 974 Detailed Occupations were included in the present research, because 74 do not have data. Second, the Major Group 55-0000 Military Specific Occupations was not included in the present research; data are not available for any Detailed Occupations within this grouping. Therefore only 22 of the original 23 SOC Major Groups were included.

The data include mean ratings for various domains, such as knowledge, skills, abilities, generalized work activities, work context, training and education, and work values. The O\*NET is unique in that the questionnaires used are scaled similarly, allowing for cross-occupation and cross-domain comparisons.

In this study, data for four of the O\*NET domains were used: Knowledge, Skills, Abilities, and Generalized Work Activities (GWAs). Each of these separate, but related, sets of data was obtained via the administration of structured questionnaires containing level and importance scales. Occupational definition and detailed task information for samples of OUs were provided to raters and used as content material. Trained analysts (primarily industrial-organizational psychology graduate students) provided level and importance ratings on the above mentioned domains for 1,122 OUs (average n raters for each occupation per domain = 6, sd = 1.3).

### *Instruments*

The O\*NET domain questionnaires varied in the numbers of descriptor items they contained, but all used seven-point, behaviorally-anchored level scales (with anchors at low, middle, and high points on the scale) and 5-point Likert type importance scales, ranging from Not Important to Extremely Important. The level scale, which appeared first in each item, included a Not Relevant (NR) option was provided. If NR was selected, then the rater was to skip the importance rating and go on to the next descriptor item. For the most part, the present study used level data; but in one instance, importance data were used. Figure 3 on the following page provides an example of an ability descriptor item.

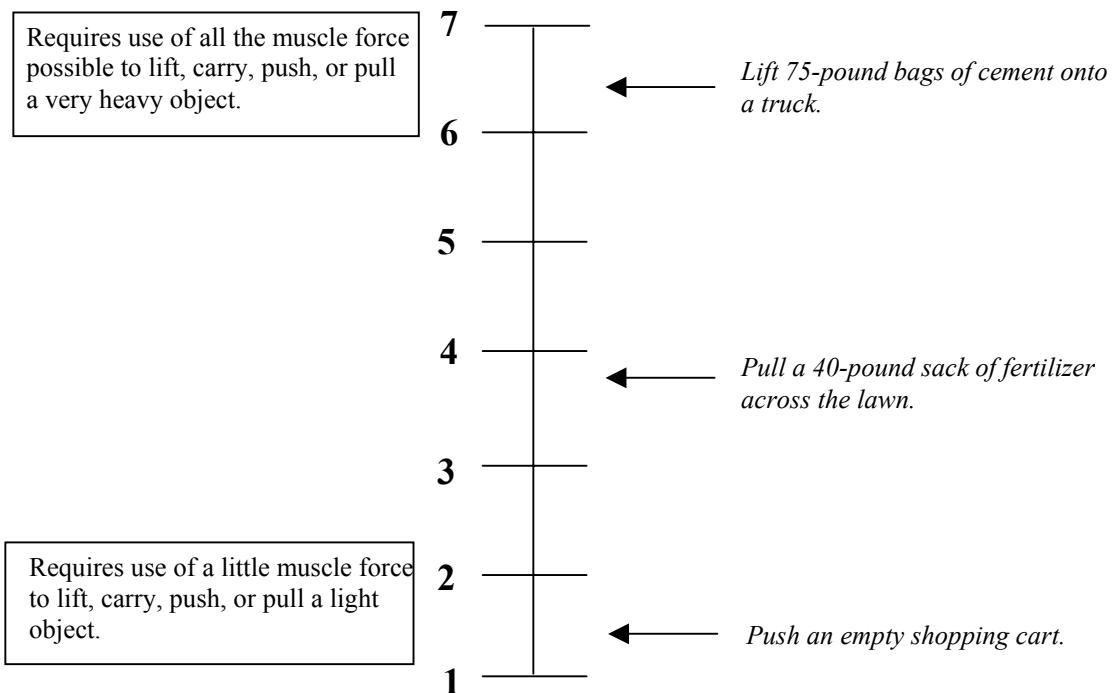

The knowledge questionnaire includes 33 descriptor items. Examples are Knowledge of Fine Arts, Knowledge of Psychology, and Knowledge of Computers/Electronics. The skills questionnaire contains 46 descriptor items, made up of 10 basic skills and 36 cross-functional skills. Examples are Writing, Instructing, and Time Management. The abilities questionnaire contains 52 cognitive, psychomotor, physical, and sensory abilities. Examples are Oral Comprehension, Number Facility, and Explosive Strength. Finally, the generalized work activities questionnaire contains 42 descriptor items. Examples are Processing Information, Performing General Physical Activities, and Communicating with Supervisors, Peers, or Subordinates.

Figure 3. Sample Ability Item: Static Strength

**32. Static Strength    The ability to exert maximum muscle force to lift, push, pull, or carry objects.**

**Level**

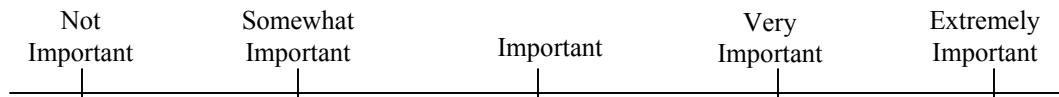

What level of this ability is needed to perform this job?

**NR** Not relevant at all for performance on this job.

**Importance**

How important is this ability to performance on this job?

## ANALYSES AND RESULTS

### Phase 1 Analyses

#### Factor Analyses

Two sets of factor analyses were carried out using two different means of classifying the O\*NET descriptors. In the present study, factor analyses were carried out similar to those in a study conducted by Clark, 2002; however the present study used the newer SOC-based O\*NET dataset (O\*NET 3.1) was used, which is a subset of that used by Clark. (Note, upon conversion to the SOC, many O\*NET occupations were dropped). The two sets of analyses and their respective results are presented below. The purpose of the factor analyses was to produce factor scores that would be used in subsequent comparative assignment analyses.

1) O\*NET Domain Factors. Principal components analyses (using ones as communality estimates) were first conducted in order to examine eigenvalue patterns. Based on Kaiser's (1970) criterion (eigenvalues greater than one), the retention of eight-, five-, seven-, and five-factor solutions for the knowledge, skills, ability, and GWA domains, respectively, was warranted. Next, each of the four O\*NET domains were subjected to a separate principal axes factor analysis (with squared multiple correlations as communality estimates) and varimax rotation. The numbers of factors rotated and retained in each analysis were as follows: eight knowledge factors, five skill factors, ten ability factors, and six GWA factors. Each domain's factor solution (salient descriptors and loadings) was judgmentally matched with comparable factor solutions derived previously by Clark (2002) and Wilson (2003). The factors solutions in the present study were very similar to those obtained in previous

research. Tables 8, 9, 10, and 11 summarize the various solutions by presenting the salient descriptors, loadings, and percentages of variance explained by each factor. Appendix A contains both the eigenvalues that resulted from the principal components analysis and the complete rotated loading matrices for each of the four retained factor solutions.

2) Concrete and Abstract O\*NET Factors. In a recent data sorting effort (Clark, 2002), all descriptor items from each of the four domains (knowledge, skills, abilities, GWAs) were re-grouped into two categories, concrete and abstract. In Clark's (2002) study, each of the resultant item categories was subjected to a factor analysis with varimax rotation, however ability descriptors were not included in those factor analyses. The present study included abilities.

First, principal components analyses were conducted and eigenvalue patterns examined. The retention of a 13-factor concrete factor solution and seven-factor

abstract solution was warranted. Next, a principal axes analysis with varimax rotation was performed on each set of abstract and concrete descriptors to generate solutions for 15 and 8 factors, respectively. Tables 12 and 13 below present the factor analysis results. Appendix A contains principal components analysis eigenvalue pattern and the complete rotated loading matrices for each of the two retained factor solutions.

### Comparative SOC Assignment Analyses

The goal of Phase 1 was to determine the best set of O\*NET variables and profile association measure ( $r$  or  $d^2$ ) to use when (a) numerically assigning Detailed O\*NET-SOC occupations into the 22 SOC Major Groups and (b) numerically developing a new numerical occupational classification structure (Phase 2). The criterion measure that was used to determine the best variable set and association measure was the *accuracy of assignment* of a sample of Detailed O\*NET-SOC Occupations back into their parent, SOC Major Group, classification. Assignment accuracy was based on the profile similarity of each individually and randomly sampled occupation with the mean profiles

for each of the Major SOC Groups. Table 8 provides a matrix overview of the Phase 1 Analyses.

Table 14.

Overview of Phase 1 Comparative Assignment Analyses: Variable Sets – Association Measure Combinations

**Variable Sets**

	<b>Individual O*NET Descriptors</b>	<b>O*NET Domain Factors (Factor Scores)</b>	<b>Concrete and Abstract O*NET Descriptor Factors (Factor Scores)</b>
<b>R</b>	Assignment Analysis 1	Assignment Analysis 3	Assignment Analysis 5
<b><math>\Sigma d^2</math></b>	Assignment Analysis 2	Assignment Analysis 4	Assignment Analysis 6

Column headings depict the variable sets that were used to compute the assignment accuracy measures. The rows list the two profile association measures that were computed and compared for each of the assignment analyses. Cell entries show that six different assignment analyses were carried out. The assignment analysis proceeded as follows:

**Step 1** – The initial intent was to sample 20 percent of the Detailed Occupations within each of the 22 Major Groups. However, because of the wide range in numbers of occupations contained in the Major Groups, it was decided that within the 20-percent sampling plan, the minimum sample size per group should be set at 2 and the maximum sample size should be limited to 10. For the purpose of comparison between variable sets and association measure combinations, the same randomly selected set of occupations was used for all assignment analysis combinations. Table 15 below contains the randomly selected occupations for each Major Group.

Table 15.

**Major Groups, Number of Occupations Randomly Selected for Comparative Assignment Analyses, and Occupation Titles**

<b>Major Group Title (Major Group Number)</b>	<b>Number of Occupations Selected, Total for Group (N = 133, N= 900)</b>	<b>Randomly Selected Occupations</b>
Management (11)	6, 34	Compensation & Benefits Mgrs.; Training & Development Mgrs.; Transportation Managers; Fish Hatchery Mgrs.; Lodging Mgrs.; Postmasters & Mail Superintendents
Business and Financial Operations (13)	6, 34	Wholesale & Retail Buyers; Environmental Compliance Inspectors; Coroners; Accountants; Personal Financial Advisors; Loan Officers
Computer and Mathematical (15)	2, 13	Computer Software Engineers, Systems Software; Computer Systems Analysts
Architecture and Engineering (17)	7, 37	Landscape Architects; Chemical Engineers; Industrial Safety & Health Engineers; Marine Architects; Petroleum Engineers; Electrical Drafters; Industrial Engineering Technicians
Life, Physical, and Social Science (19)	9, 47	Plant Scientists; Soil Scientists; Microbiologists; Zoologists & Wildlife Biologists; Market Research Analysts; I-O Psychologists; Archeologists; Political Scientists; Nuclear Equipment Operating Technicians
Community and Social Services (21)	2, 11	Substance Abuse & Behavioral Disorder Counselors; Child, Family, & School Social Workers
Legal (23)	2, 8	Judges & Magistrates; Title Searchers
Education, Training, and Library (25)	8, 43	Engineering Teachers, Postsecondary; Nursing Instructors & Teachers, Postsecondary; Preschool Teachers, Except Special Ed; Elementary School Teachers, Except Special Ed; Vocational Ed Teachers, Middle school; Special Ed Teachers; Secondary School; Librarians; Instructional Coordinators
Arts, Design, Entertainment, Sports, & Media (27)	9, 49	Painters & Illustrators; Sketch Artists; Interior Designers; Music Directors; Composers; Radio & TV Announcers; Creative Writers; Audio & Video Equipment Technicians; Film & Video Editors
Healthcare Practitioner and Technical (29)	8, 44	Orthodontists; Anesthesiologists; Surgeons; Podiatrists; Physical Therapists; Speech-Language Pathologists; Dental Hygienists; Licensed Practical & Licensed Vocational Nurses
Healthcare Support (31)	2, 11	Dental Assistants; Medical Equipment Preparers
Protective Service (33)	5, 26	First Line Supervisors/Mgrs. of Police &

<b>Major Group Title (Major Group Number)</b>	<b>Number of Occupations Selected, Total for Group (N = 133, N= 900)</b>	<b>Randomly Selected Occupations</b>
		Detectives; Forest Fire Fighting & Prevention Supervisors; Fire Inspectors; Bailiffs; Highway Patrol Pilots
Food Preparation and Serving-Related (35)	3, 15	Restaurant Cooks; Nonrestaurant Food Services; Dishwashers
Building and Grounds Cleaning and Maintenance (37)	2, 10	Housekeeping Supervisors; Lawn Service Managers
Personal Care and Service (39)	5, 27	First Line Supervisors/Managers of Personal Service Workers; Gaming & Sports Book Writers & Runners; Motion Picture Projectionists; Embalmers; Make-Up Artists, Theatrical & Performance
Sales and Related (41)	4, 24	Parts Sales Persons; Financial Services Sales Agents; Demonstrators & Product Promoters; Door-to-Door Sales Workers, News & Street Vendors, or Related Workers
Office and Administrative Support (43)	10, 65	Bill & Account Collectors; Billing, Cost, & Rate Clerks; Billing, Posting, & Calculating Machine Operators; Bookkeeping, Accounting, & Auditing Clerks; Procurement Clerks; Credit Authorizers; Credit Checkers; Interviewers, Except Eligibility & Loan; Receptionists & Information Clerks; Sales Floor Stock Clerks
Farming, Fishing, and Forestry (45)	3, 19	First Line Supervisors/Managers/Supervisors of Agricultural Crop Workers; First Line Supervisors/Managers/Supervisors of Logging Workers; Hunters & Trappers
Construction and Extraction (47)	10, 64	Ship Carpenters & Joiners; Cement Masons & Concrete Finishers; Electricians; Glaziers; Pipelaying Fitters; Helpers-Brick Masons, Block Masons, Stone Masons, & Tile & Marble Setters; Helpers-Electricians; Irradiated Fuel Handlers; Rail Track Laying & Maintenance Equipment Operators; Quarry Rock Splitters
Installation, Maintenance, and Repair (49)	10, 69	Telecommunications Facility Examiners; Electric Motor & Switch Assemblers & Repairers; Transformer Repairers; Automotive Glass Installers & Repairers; Automotive Master Mechanics; Outdoor Power Equipment & Other Small Engine Mechanics; Recreational Vehicle Service Technicians; Refractory Materials Repairers, Except Brick Masons; Electrical Power Line Installers & Repairers; Fabric Menders, Except Garment
Production (51)	10, 192	Electrical & Electronic Equipment Assemblers; Metal Molding, Coremaking, & Casting Machine Set-Up Operators & Tenders; Soldering & Brazing Machine Operators & Tenders; Dot Etchers; Precision Printing Workers; Engraver Set-Up Operators; Power

Major Group Title (Major Group Number)	Number of Occupations Selected, Total for Group (N = 133, N= 900)	Randomly Selected Occupations
		Auxiliary Equipment Operators; Furnace, Kiln, Oven, Drier, & Kettle Operators & Tenders; Pewter Casters & Finishers; Hand Engravers
Transportation and Material Moving (53)	10, 58	Commercial Pilots; Transit & Inner City Bus Drivers; Heavy Truck Drivers; Railroad Conductors & Yardmasters; Ordinary Seamen & Marine Oilers; Ship Pilots; Public Transportation Inspectors; Conveyor Operators & Tenders; Grips & Set Up Workers, Motion Picture Sets, Studios, & Stages; Pump Operators, Except Wellhead Pumpers

**Step 2** - The centroid (i.e., mean profile) for each of the 22 Groups was computed based on the remaining occupations in its respective Group. For cases where the variables were factors (refer to columns 2 and 3 in Table 14), means were computed using factor scores that were obtained for all occupations on each of the resultant factors.

**Step 3** - For each occupation in the samples, association indices ( $r$  and  $d^2$ ) were computed between that occupation's variable profile and the mean profile for each of the 22 Major Groups.

**Step 4** – For each selected occupation, it was determined whether the association measure with its “parent” SOC Major Group had the highest  $r$  or smallest  $d^2$  value among that occupation's association indices (note that  $r$  and  $d^2$  values were compared separately). Each instance where that occurred was recorded a “hit.” A comprehensive listing of all computed association indices can be found in Appendix B. Steps 3 and 4 were repeated for each of the six combinations shown in Table 8.

**Step 5** – The percentage of “hits” overall (i.e., the total for all Groups) and per Group was calculated and reported for each of the six combinations. Table 16 below provides

the overall hit rate results. Appendix B contains hit rate results for each of the individual Major Groups.

Table 16.

Overall Hit Rate Results and Percentages for each of the 6 Variable Set – Association Measure Combinations

<b>Variable Sets</b>			
	<b>Individual O*NET Descriptor Items</b>	<b>O*NET Domain Factors (Factor Scores)</b>	<b>Concrete and Abstract O*NET Descriptor Factors (Factor Scores)</b>
<b>R</b>	94 hits/133 = <b>71%</b>	95 hits/133 = <b>71%</b>	90 hits/133 = <b>68%</b>
<b><math>\Sigma d^2</math></b>	83 hits/133 = <b>62%</b>	98 hits/133 = <b>74%</b>	100 hits/133 = <b>75%</b>

**Step 6** – First, the percentage of hits for each combination (i.e., each cell in Table 16 above) was tested to determine if the hit rate exceeded chance (Garrett, 1962) was carried out to determine whether the hit rate percents exceeded chance. It was found that all hit rates exceeded chance ( $p < .01$ ). Second, each pairwise combination of hit rates was tested to determine whether or not a significant difference existed between the six combinations. Only one combination, the individual O\*NET descriptor –  $d^2$ , was found to be significantly different from two others, the domain factor –  $d^2$  combination ( $p < .05$ ) and the concrete/abstract descriptor factor –  $d^2$  combination ( $p < .05$ ).

**Step 7** – Of the six combinations, the one with the highest percent value was found to be the O\*NET Abstract/Concrete Factors with squared Euclidian distance as the association measure (75% hit rate percent; see row 2, column 3 in Table 16 above). However, this combination was determined not to be significantly different from the O\*NET Domain Factors with squared Euclidian distance as the association measure

(74% hit rate percent; see row 2, column 2 in Table 16 above). Because the domain factors carry more practical utility, as well as face validity, the domain factor – squared Euclidian distance combination was used in further analyses.

Two additional comparative assignment analyses were carried out as part of the overall exploratory effort. First, O\*NET *importance* data were used with the individual descriptor – correlation combination (refer to row 1, column 1 in Table 16). The hit rate was 71% ( $p < .05$ ). Second, an assignment analysis with the Concrete factor – squared Euclidian distance combination was carried out. The hit rate was determined to be 69% ( $p < .05$ ). Appendix C contains the assignment analysis results for these two combinations of variable sets and profile association measures.

## Phase 2 Analyses

### Overview

Phase 2 consisted of three parts. First, the selected descriptor-association measure combination (domain factors –  $d^2$ ) was incorporated into a more rigorous assignment analysis at a more detailed level within the SOC (i.e., the 96 Minor Group level). This was expected to be a more difficult test than previous Phase 1 assignment analyses, because it required the O\*NET descriptors to make a more “fine-grained” differentiation between Groups (personal communication; Cunningham, February 2002).

Second, the Phase 1 selected variable set/association measure combination was used in an unstructured, exploratory cluster analysis of all Detailed Occupations in order to derive a new numerical occupational classification structure. Twenty-two resultant clusters were judgmentally compared to the existing 22 Major SOC Groups.

Third, an *a priori*, structured approach to the development of a revised SOC was explored (see Cunningham, Drewes, & Powell, 1995). This structured approach is described below in Part 3.

### Part 1. SOC Minor Group Assignment Analysis

The following assignment analysis proceeded in a similar fashion to that described in Phase 1. However, whereas the 22 Major Group level was employed in Phase 1, this analysis used 93 SOC Minor Groups at a more specific level in the SOC hierarchical classification structure. Three Minor Groups classified under 55-0000 Military-Specific Occupations were not included in this study, because no data is available for occupations in this Group. Each of the Minor Groups is subsumed under its respective Major Group heading. For example, “Management Occupations” is a Major Group title, and within Management, “Top Executives” is a Minor Group title. Based on the results of the previously described comparative assignment analysis, the domain factor –  $d^2$  combination was the only one used in the Minor Group assignment analysis. The assignment analysis proceeded as follows:

**Step 1** - Twenty percent of the Detailed Occupations were sampled randomly within each of the 93 Minor Groups, with the exception that each group was to be represented by a minimum of 1 and maximum of 10 selected occupations.

**Step 2** - The centroid (i.e., mean profile) for each of the Minor Groups was computed using factor scores for the remaining occupations in each respective Group. Note that because some Minor Groups contained very small numbers of Detailed Occupations, only Groups with occupations numbering four or greater ( $n = 70$ ) were included in the

assignment analysis. This was necessary in order to be able to compute the mean centroids.

**Step 3** - For each randomly selected occupation, the association measure ( $d^2$ ) was computed between that occupation's variable profile and the mean profile for each of the 70 Minor Groups.

**Step 4** – For each randomly selected occupation, it was determined whether the association measure with its “parent” SOC Minor Group had the smallest  $d^2$  value among that occupation's association indices.

**Step 5** – The percentage of “hits” overall (i.e., the total for all Groups) and per Group were calculated. The overall hit rate results were as follows: 118 hits / 173 total occupations selected (i.e., a 68% hit rate percent). Appendix D presents hit rate results for the individual 70 Minor Groups.

A second hit rate calculation was carried out, based on the Minor Group assignment analysis results. While the aforementioned hit rate computation only allowed a “hit” if an occupation was returned to its parent Minor Group, this calculation counted a “hit” if an occupation was returned to either its parent Minor Group or to another Minor Group that was a member of the same parent Major Group. Under this second, less rigorous criterion, the hit rate increased considerably, yielding 139 hits/173 total, or 80%.

**Step 6** – Statistical testing (Garrett, 1962) was carried out to determine whether the hit rates exceeded chance. All hit rate percentages exceeded chance ( $p < .05$ ).

## Part 2: Unstructured Numerical Cluster Analysis

The 900 Detailed Occupations were subjected to an exploratory cluster analysis to derive numerical clusters for comparison with the SOC Major Groups. In this analysis, the Ward-Hook (1963) hierarchical clustering procedure was applied to the previously selected domain factor –  $d^2$  association measure combination to produce 22 clusters. The resultant occupational clusters were then judgmentally compared to the 22 Major Groups within the SOC, and indices of percent membership overlap (PMO) were computed between the clusters and their matched Major Groups.

Table 17 presents the cluster titles, matching SOC Major Group titles, and the PMO values. Four clusters that could not be interpreted are omitted from Table 17. These clusters contained a mixture of Detailed Occupations from various Major Groups. Overall, 50% of the derived clusters were deemed comparable to SOC classifications. Appendix E contains the cluster analysis results, including cluster membership with salient occupations.

Table 17.

### Unstructured, Overall Cluster Analysis Results: Cluster Title, SOC Code>Title, and Percent Membership Overlap

<u>Cluster Title</u>	<u>Matched SOC Code&gt;Title</u>	<u>PMO</u>
1) Managers & Supervisors	11-0000 Management	48%
2) Architects & Engineers	17-0000 Architecture & Engineering	43%
3) Life, Physical, & Social Scientists & Related Technicians	19-0000 Life, Physical, & Social Science	39%
4) Design, Entertainment, & Media	27-0000 Arts, Design, Entertainment, Sports, & Media	20%
5) Administrative	43-0000 Office & Administrative Support	23%

<u>Cluster Title</u>	<u>Matched SOC Code/Title</u>	<u>PMO</u>
6) Production	51-0000 Production	41%
7) Teachers, Counselors, & Therapists	No match	--
8) Office Support	43-0000 Office & Administrative Support	19%
9) Computers	15-0000 Computers & Mathematical	53%
10) Installation, Maintenance, & Repair	49-0000 Installation, Maintenance, & Repair	53%
11) Healthcare Practitioners & Technicians	29-0000 Healthcare Practitioners & Technical	51%
12) Education/Teaching	25-0000 Education, Training, & Library *25-1000 Postsecondary Teachers*	33% 64%
13) Sports, Fitness, & Dance	27-0000 Arts, Design, Entertainment, Sports, & Media *27-2000 Entertainers & Performers, Sports & Related*	6% 18%
14) Public Safety & Personal Care	No match	--
15) Music & Instrument Repair	27-0000 Arts, Design, Entertainment, Sports, & Media AND 49-0000 Installation, Maintenance, & Repair *27-2000 Entertainers & Performers, Sports & Related AND 49-9000 Other Installation, Maintenance, & Repair* **27-2040 Musicians, Singers, & Related AND 49-9060 Precision Instrument & Repair**	8% 20% 90%
16) Transportation & Material Moving	53-0000 Transportation & Material Moving	39%

Note.

SOC codes/titles marked with one asterisk denotes a better match at the Minor Group level. In one instance, the SOC code/title marked with two asterisks denotes a better match at the Broad Occupation level. For Cluster 15, Music & Instrument Repair, the PMO was computed based on its ideal match with two SOC classifications. It is in this case that the best match is clearly at the “dual” Broad Occupation level.

### Part 3. Structured Derivation of an Occupational Classification Framework

Analysis 1. Cluster analyses within the 22 SOC Major Groups. Separate cluster analyses were performed within each of the 22 Major Groups were performed, applying Ward’s procedure to the domain factor –  $d^2$  association measure combination. Within

each Major Group, the numerically derived clusters were judgmentally compared to that Major Group's constituent Minor Group. Comparable O\*NET-SOC Groups were matched and PMO indices were computed for each pair of matched groups. Table 18 contains titles of the derived clusters matched to comparable SOC Minor Groups and, in a few instances, to Broad Occupations. The PMO indices between pairs of matched Groups are presented Table 18, as well. Appendix F contains the cluster analysis results, including cluster membership with salient occupations.

There were 47 matches made with the 93 possible Minor Groups, yielding an overall PMO of 51%. Nine of the derived clusters matched better at the Broad Occupation level, resulting in higher PMOs. These are highlighted with asterisks in Table 18. The range of PMOs was 40% to 100%. The mean PMO was 66% and the standard deviation of the PMOs was 21%.

Table 18.

Structured Cluster Analyses Within Major Groups: Major Group, Cluster Title, Matched SOC Code/Title, and Percent Measurement Overlap (PMO)

<b>Major Group 11 - Management</b>		
<b>Cluster Title</b>	<b>Matched SOC Code &amp; Title</b>	<b>PMO</b>
Operations Managers	11-3000 Operations Managers	58%
Miscellaneous Managers	11-9000 Management, Other	48%
Engineering & Science Managers	No match	--

Analysis 2. Cluster analyses within selected SOC Minor Groups. Separate cluster analyses (using Ward's method) were carried out within selected SOC Minor Groups ( $n = 12$ ), employing the previously described procedure. Minor Groups chosen met the following criteria and thus were (a) Groups with numbers of Detailed Occupations  $\geq 30$ , (b) Groups that were judged promising based on previous Minor Group assignment analysis and the exploratory cluster analysis, and (c) Groups that yielded low PMOs (< 50%) in the structured cluster analyses within Major Groups. The resultant clusters were judgmentally compared to SOC Broad Occupations (one level below the Minor Group level) and PMOs were computed

Overall, the cluster matches (60%) and PMOs were better than results of previous analyses at the Major Group level. The range of PMOs was 33% to 100%. The mean PMO was 72% and the standard deviation was 27%. Many matches between derived clusters and SOC Broad Occupations resulted in PMOs of 75% or higher. Table 19 presents the results, including Minor Groups, cluster titles, matched SOC titles, and PMO

indices. Appendix G contains the cluster analysis results, including cluster membership with salient occupations.

Note.

In total, fourteen Minor Groups were selected for inclusion in this set of cluster analyses.

Analysis 3. Construct an *a priori* conceptual classification framework. An O\*NET Job Zone<sup>1</sup> (5) x SOC Major Group (22) matrix was constructed containing 110 cells.

Each of the cells included its respective set of Detailed Occupations. The Detailed

---

<sup>1</sup> In previous SOC conversion work, O\*NET Job Zones were assigned to each of the Detailed SOC Occupations. Job Zones represent levels of education, experience, and training required to gain employment in a certain occupation. Job Zone 5 requires the highest level of education, such as attaining an advanced degree, and extensive training and experience. Job Zone 1 requires minimal education, experience, and training. Each Detailed Occupation included in this study has been assigned one Job Zone.

Occupation memberships within the 110 cells were judgmentally compared to those Detailed Occupations contained within the 93 SOC Minor Groups, in order to determine whether or not any reasonable matches exist between the two classification structures. After an extensive review of cell membership, it was determined that there were no meaningful groupings of occupations within most cells. In addition, no reasonable matches to SOC groups could be made. The Job Zone by SOC Major Group matrix did not yield a meaningful, alternative classification structure. Appendix H presents the matrix.

Analysis 4. Estimating job zone membership from selected O\*NET variables.

O\*NET domain (knowledge, skills, abilities, & GWAs) factors ( $n=29$ ) were used to estimate Job Zone assignments. The Job Zone estimates were derived through multiple regression analysis (both traditional and stepwise) using the O\*NET domain factors as  $X$  variables and the Job Zone assignments as the  $Y$  variable. The multiple R was found to be .80 ( $p<.001$ ). Subsequently, a discriminant analysis, that treated Job Zone as a categorical variable, was carried out in order to assign Job Zones to the 900 occupations. The assignment rate was 53%. Of the remaining 47% incorrect assignments, 85% missed by only one Job Zone. The O\*NET domain factors did reasonably well at assigning the appropriate Job Zones to SOC occupations. Appendix I summarizes the multiple regression and discriminant analyses results.

## DISCUSSION

The O\*NET descriptors were used to determine their usefulness in assigning occupations into SOC categories, generating a new, meaningful classification structure, replicating occupational groupings within the SOC hierarchy, and assigning job zones to occupations. Overall, the O\*NET descriptors performed well across those project tasks, but they did not produce a cluster structure resembling the SOC Major Groups.

Initially, an analysis effort was undertaken that compared the effectiveness of six different variable set-association measure combinations in assigning occupations to their parent SOC Major Groups. These combinations and their assignment percentages (hit rates) were as follows: (a) Individual O\*NET descriptors with  $r = .71$ ; (b) Individual O\*NET descriptors with  $d^2 = .62$ ; (c) O\*NET domain factors with  $r = .71$ ; (d) O\*NET domain factors with  $d^2 = .74$ ; (e) Concrete/abstract O\*NET factors with  $r = .68$ ; and (f) Concrete/abstract O\*NET factors with  $d^2 = .75$ .

The variables used in combinations 3 through 6 above were derived through several factor analyses. These analyses produced 29 O\*NET domain factors (8 knowledge, 5 skill, 10 ability, and 6 GWA factors) and 23 concrete and abstract factors (15 concrete and 8 abstract factors). To date this is the only study that has factor analyzed the O\*NET knowledge, skill, ability, and generalized work activity domains using SOC-based O\*NET data. All factor analyses produced solutions nearly identical to those from similar efforts that employed the original O\*NET data (Clark, 2002). These results provide some empirical support for the adequacy of the judgmental data conversion effort that transformed O\*NET to a SOC-based system.

Two additional comparative assignment analyses were carried out. The first analysis was carried out to determine whether the importance data would produce a higher hit rate than would the level data. This analysis used individual O\*NET descriptors with  $r$ , but used importance data instead of level data. The assignment percentage was found to be 71%, which was the same as that obtained with level data. This result is not surprising, because the two scales have been shown in prior studies (Peterson, Mumford, Borman, Jeanneret, and Fleishman, 1999) to be highly correlated. The second analysis was carried out to determine if the Concrete factors alone would produce as high a hit rate as the Concrete and Abstract factors combined. The second used only concrete O\*NET factors with  $d^2$ , resulting in an assignment percent of 69% that was not as high as the 75% hit rate that resulted when Concrete and Abstract factors were combined.

Among all the comparative assignment analyses performed, only the hit rate for the combination of individual descriptors with  $d^2$  (62%) was found to be significantly different from the rest. It is possible that the individual descriptors were more sensitive than the factors to elevation differences present in the data, thus producing a lower hit rate. After careful review, it was determined that the most appropriate combination for use in all subsequent analyses was the O\*NET domain factor –  $d^2$  combination. This decision was based on both practical and empirical considerations. First, even though the Concrete/Abstract factor –  $d^2$  combination produced the highest hit rate (75%), the O\*NET domain factors (with a hit rate of 74%) possess a higher element of face validity; they have all been named, are meaningful, and belong to an established conceptual framework with which potential users are familiar. It is possible that a smaller number of meaningful variables (i.e., factors) can substitute for lengthy lists of descriptors in future

surveys and taxonomy development. Second, O\*NET stakeholders have both research and practical interests in domain factors derived from SOC-based O\*NET data. The close similarity between the SOC- and OU-based domain factors lends empirical support to the conversion effort that collapsed the original OU data into data now describing a smaller number of SOC occupations. It may also help streamline future O\*NET data collection efforts by potentially reducing questionnaires' length, thereby minimizing the burden on respondents.

Subsequent to the aforementioned analyses, the O\*NET domain factor –  $d^2$  combination was used in a more rigorous assignment analysis at the SOC Minor Group level. In the initial computation of hit rate percentage, a “hit” was counted only when an occupation was returned to its parent Minor Group. Based on this calculation, the overall hit rate percentage was 69%. A second calculation was made that counted a “hit” if an occupation was returned to either its parent Minor Group or its parent Major Group. Based on this calculation, the hit rate percentage increased to 80%. It appears that at a more detailed occupational level (i.e., the SOC Minor Group level), the O\*NET domain factors do a better job of assigning occupations to Major Groups.

The O\*NET domain factor –  $d^2$  combination was next used in an exploratory cluster analysis of all 900 occupations. Some clusters were named, included meaningful listings of occupations, and produced reasonable membership overlap with SOC Major Groups. Clusters that matched reasonably well with Major Groups [i.e., with percent membership overlaps (PMOs) > 40%] were titled Managers/Supervisors, Architects & Engineers, Production Occupations, Computer Occupations, Installation, Maintenance, & Repair Occupations, and Healthcare Practitioners & Technicians. Other clusters exhibited only

slight to moderate overlap with SOC Major Groups (with PMOs ranging from 6% to 39%); some did not match with any of the 22 Major Groups, but did match well at more specific levels within the SOC hierarchy (i.e., at the Minor Group and Broad Occupation levels). Finally, seven remaining clusters contained a mixture of occupations from various SOC categories such that they were not interpretable at all. Table 17 summarizes the exploratory cluster analysis results.

It is not surprising that the resultant structure did not reproduce all 22 Major Groups contained in the SOC. During the initial development as well as in past revisions of the SOC, several factors affected the placement of occupations within categories, many of which were neither data driven nor empirical. The creation and placement of SOC categories and occupational titles was often based on (a) the judgments of occupational experts; (b) economic and labor market-driven factors; (c) work function only without the consideration of knowledge, skills, and abilities; and finally, (d) the political pull of various union groups or professional associations wanting their occupations categorized within a particular area. Moreover, the clustering of occupations in this study utilized numeric data associated with knowledge, skill, and ability domains that were not considered during the rational SOC development process. Nevertheless, the exploratory cluster analysis carried out in this study did provide some empirical support for the SOC at the Major Group level.

Following the overall cluster analysis, two structured cluster analyses were carried out within confined categories of the SOC (i.e., within all 22 Major Groups and within 14 selected Minor Groups). The resultant cluster solutions were each compared separately with their respective SOC Minor Groups and Broad Occupations. Both analyses yielded

meaningful clusters. Many were judgmentally matched to SOC groups, and the corresponding PMO values neared or equaled 100%. Clustering within levels of the SOC did a better job of producing clusters that resembled SOC categories than did the previous exploratory clustering of all 900 occupations. These results thus provide some empirical support for the judgmentally-derived SOC, specifically at the Minor Group and Broad Occupation levels.

The O\*NET Job Zones indicate level of training, education, and experience required to gain employment in the various O\*NET occupations and range from 1 to 5. Every occupation in the SOC has been previously assigned one Job Zone. In this study, two analyses were carried out that used the O\*NET Domain Factor –  $d^2$  data and incorporated O\*NET Job Zone data for each of the 900 SOC occupations.

First, a structured, matrix approach to developing a classification structure was employed. A Major Group ( $n=22$ ) by Job Zone ( $n=5$ ) matrix was created, containing occupations as cell entries. Occupations within cells were judgmentally compared with occupations contained in SOC Minor Groups ( $n=93$ ). No reasonable matches could be made, nor did most cells contain meaningful groupings of occupations. Because Job Zones are generic in nature and the same Job Zone can be used to describe very different occupations (e.g., both Surgeons and Electrical/Electronic Equipment Repairers have been assigned Job Zone 5, “Extensive Preparation Needed”), it is understandable that, in this case, unwieldy mixtures of occupations occurred within matrix cells. It was concluded that a Job Zone  $\times$  SOC Major Group matrix did not offer a viable approach to the development of an occupational taxonomy.

Second, the O\*NET Domain Factors were used as predictors in a multiple regression analysis in which Job Zone was the dependent variable. This analysis yielded a multiple R of .80 ( $p < .0001$ ). To further test the hypothesis that the O\*NET Domain Factors could be used to predict occupational Job Zone assignments, a discriminant analysis was carried out that treated Job Zone as a categorical variable (i.e., categories 1 – 5) and the Domain Factors as variables for assigning the 900 O\*NET occupations to Job Zone categories. The results showed that Job Zones were correctly assigned to occupations 53% of the time. Of the 47% incorrectly assigned, 95% were only off by one Job Zone.

Because of the possibility of shrinkage, these results may overestimate both the multiple R and the assignment rate to some extent; however, the large sample size in this study ( $n = 900$ ) should place some limits on inflation from capitalization on chance. In a number of cases, the discriminant function incorrectly assigned Job Zones, either one point too high or one point too low, when the predicted value fell between two Job Zones. This would explain why so many Job Zone assignments were only one away from their original assignments. For that reason, it may be worthwhile to consider using multiple regression instead of discriminant analysis to assign Job Zones to occupations. Human judgment could then be employed to break “in-the-middle” ties. Overall, these results point to the potential usefulness of the Domain factors as Job Zone estimators, particularly in assigning Job Zones to new and emerging occupations.

Similar studies have been carried out that support the use of the O\*NET descriptors for predictive purposes, especially in estimating occupational aptitude requirements. Johnson, Carter, & Dorsey (2003) used O\*NET descriptors to predict mean General Aptitude Test Battery (GATB) scores. They found that O\*NET descriptors did well to

predict cognitive and perceptual speed aptitudes. D'Egidio (2001) used a job component approach to link O\*NET descriptors to mean scores on cognitive ability tests. Cognitive aptitudes were found to be predictable from O\*NET descriptors. Wilson (2003) found that factors derived from occupational ratings on the O\*NET Knowledge, Skills, and GWAs were predictive of the O\*NET Ability ratings. The above studies and the present research effort, taken together, demonstrate the potential usefulness of the O\*NET descriptors as prediction tools within the realms of occupational aptitude and training/education/experience (i.e., Job Zone) requirements.

### Future Research

The present study has many firsts. It was the first to carry out comparative assignment analyses with occupations. It was the first to employ a numerical clustering technique using the new SOC-based O\*NET data. Finally, it was the first study to devise an empirical and practical method for assigning Job Zones to new occupations that may one day be added to the O\*NET system. Along with these firsts come some limitations as well as some starting points for future research.

Although factor replication analyses were not carried out in the present study, Clark (2002) did find the original OU-based Domain factors to be replicable. The fact that the present study's SOC-based Domain factors closely match those derived by Clark offers some support for their stability, as well.

The cluster analyses performed (both structured and unstructured) were exploratory in nature. Results yielded some meaningful clusters that resembled SOC categories. Because data were not available for individual raters, it would have been difficult to test

clusters for replication in this study. Future studies may consider (1) developing a method for testing cluster stability and replicability without the availability of individual rating data (e.g., through centroid comparisons across comparable occupational subsamples) and (2) employing a confirmatory approach to numerical clustering. While confirmatory factor analysis has been shown to be a preferred and rigorous statistical technique, there has not been an approach devised that can be applied to cluster analysis (e.g., confirmatory cluster analysis).

Johnson, Carter, & Dorsey (2003) offer some data inclusion (or exclusion) criteria when engaging in this type of research. First, it may be possible to eliminate descriptor redundancies across domains. “For example, mathematical reasoning ability, mathematics skill, and mathematics knowledge are similar [and found to be highly correlated], so it would only be necessary to include one of these descriptors in... [future analyses involving O\*NET data]” (p. 7). Second, eliminating redundancies within [O\*NET] domains may be a preferable approach. “Within a domain, some descriptors are likely to be highly correlated. One descriptor [may not] contribute much beyond the other if both are included in the [analysis]. For example, deductive and inductive reasoning ability [have been found to be] highly correlated...” (p. 7), thus warranting the inclusion of only one in future analyses.

O\*NET provides two types of scale data, level and importance. The present study employed level data except for one assignment analysis that used importance data for comparative purposes. For that one exception, no difference was found between assignment rates when both importance and level data were used. In addition, previous research has shown these scales to be highly correlated, so it is likely that replicating this

study using importance data would produce similar results. However, carrying out a research effort similar to the present study but using importance data may provide additional empirical support for the use of O\*NET descriptors as tools in occupational analysis, and is therefore recommended.

Presently, the National O\*NET Consortium is leading a Nationwide data collection initiative that will re-populate the O\*NET database with data obtained from job incumbents. (The present study's data were provided by job analysts and industrial-organizational psychology graduate students; O\*NET data version 3.1.) It would be worthwhile in a future effort to use job incumbent data to see whether it will outperform analyst data in both numerical occupational classification and Job Zone estimation.

Finally, the National Center for O\*NET Development has recently completed an effort that developed cross-occupational descriptors known as Detailed Work Activities (personal communication; Smith, May 2003). These activity statements, originally named "skill statements," have been categorized into the 42 O\*NET generalized work activity categories and assigned to each of the O\*NET occupations. They are considerably more specific than the existing O\*NET skills, yet are still "transportable" across occupations. A future study may test whether the Detailed Work Activities fare better than the generic O\*NET descriptors, used in the present effort, as tools in occupational classification and job zone estimation.

Unstructured Exploratory Cluster Analysis Results

Occ Code	Occ Title
<b>Cluster 1 - Managers &amp; Supervisors</b>	
11-1011.01	Government Service Executives
11-1011.02	Private Sector Executives
11-2011.00	Advertising and Promotions Managers
11-2021.00	Marketing Managers
11-2022.00	Sales Managers
11-3011.00	Administrative Services Managers
11-3021.00	Computer and Information Systems Managers
11-3031.01	Treasurers, Controllers, and Chief Financial Officers
11-3031.02	Financial Managers, Branch or Department
11-3040.00	Human Resources Managers
11-3041.00	Compensation and Benefits Managers
11-3042.00	Training and Development Managers
11-3051.00	Industrial Production Managers
11-3061.00	Purchasing Managers
11-3071.01	Transportation Managers
11-3071.02	Storage and Distribution Managers
11-9011.01	Nursery and Greenhouse Managers
11-9011.02	Agricultural Crop Farm Managers
11-9011.03	Fish Hatchery Managers
11-9012.00	Farmers and Ranchers
11-9021.00	Construction Managers
11-9031.00	Education Administrators, Preschool and Child Care Center/Program
11-9032.00	Education Administrators, Elementary and Secondary School
11-9033.00	Education Administrators, Postsecondary
11-9051.00	Food Service Managers
11-9061.00	Funeral Directors
11-9071.00	Gaming Managers
11-9081.00	Lodging Managers
11-9111.00	Medical and Health Services Managers
11-9121.00	Natural Sciences Managers
11-9131.00	Postmasters and Mail Superintendents
11-9141.00	Property, Real Estate, and Community Association Managers
11-9151.00	Social and Community Service Managers
13-1011.00	Agents and Business Managers of Artists, Performers, and Athletes
13-1073.00	Training and Development Specialists
13-1121.00	Meeting and Convention Planners
25-4012.00	Curators
27-2012.01	Producers
27-2012.03	Program Directors
33-1012.00	First-Line Supervisors/Managers of Police and Detectives
35-1011.00	Chefs and Head Cooks
	First-Line Supervisors/Managers of Food Preparation and Serving
35-1012.00	Workers
35-2014.00	Cooks, Restaurant

<b>Occ Code</b>	<b>Occ Title</b>
35-9031.00	Hosts and Hostesses, Restaurant, Lounge, and Coffee Shop
37-1011.01	Housekeeping Supervisors
37-1011.02	Janitorial Supervisors
37-1012.01	Lawn Service Managers
37-1012.02	First-Line Supervisors and Manager/Supervisors - Landscaping Workers
39-1011.00	Gaming Supervisors
39-1012.00	Slot Key Persons
39-9032.00	Recreation Workers
41-1011.00	First-Line Supervisors/Managers of Retail Sales Workers
41-1012.00	First-Line Supervisors/Managers of Non-Retail Sales Workers
43-1011.01	First-Line Supervisors, Customer Service
43-1011.02	First-Line Supervisors, Administrative Support
	First-Line Supervisors and Manager/Supervisors - Agricultural Crop Workers
45-1011.01	First-Line Supervisors and Manager/Supervisors - Animal Husbandry Workers
45-1011.02	First-Line Supervisors and Manager/Supervisors - Animal Care Workers, Except Livestock
45-1011.04	First-Line Supervisors and Manager/Supervisors - Horticultural Workers
45-1011.06	First-Line Supervisors and Manager/Supervisors - Fishery Workers
45-2091.00	Agricultural Equipment Operators
45-2092.02	General Farmworkers
	First-Line Supervisors and Manager/Supervisors- Construction Trades Workers
47-1011.01	First-Line Supervisors and Manager/Supervisors- Extractive Workers
47-5013.00	Service Unit Operators, Oil, Gas, and Mining
49-1011.00	First-Line Supervisors/Managers of Mechanics, Installers, and Repairers
51-1011.00	First-Line Supervisors/Managers of Production and Operating Workers
	First-Line Supervisors/Managers of Transportation and Material-Moving Machine and Vehicle Operators
<b>Cluster 2 - Architects &amp; Engineers</b>	
11-9041.00	Engineering Managers
13-1111.00	Management Analysts
17-1011.00	Architects, Except Landscape and Naval
17-2041.00	Chemical Engineers
17-2051.00	Civil Engineers
17-2071.00	Electrical Engineers
17-2072.00	Electronics Engineers, Except Computer
17-2112.00	Industrial Engineers
17-2121.01	Marine Engineers
17-2121.02	Marine Architects
17-2131.00	Materials Engineers
17-2141.00	Mechanical Engineers
17-2151.00	Mining and Geological Engineers, Including Mining Safety Engineers
17-2161.00	Nuclear Engineers
17-2171.00	Petroleum Engineers

<b>Occ Code</b>	<b>Occ Title</b>
17-3012.02	Electrical Drafters
17-3022.00	Civil Engineering Technicians
17-3026.00	Industrial Engineering Technicians
17-3027.00	Mechanical Engineering Technicians
27-3042.00	Technical Writers
<b>Cluster 3 - Life, Physical, &amp; Social Scientists and Related Technicians</b>	
13-1021.00	Purchasing Agents and Buyers, Farm Products
13-1041.01	Environmental Compliance Inspectors
13-1041.06	Coroners
15-2021.00	Mathematicians
15-2041.00	Statisticians
15-3011.00	Mathematical Technicians
17-2011.00	Aerospace Engineers
17-2111.01	Industrial Safety and Health Engineers
17-2111.02	Fire-Prevention and Protection Engineers
17-2111.03	Product Safety Engineers
17-3023.01	Electronics Engineering Technicians
17-3023.02	Calibration and Instrumentation Technicians
17-3023.03	Electrical Engineering Technicians
19-1011.00	Animal Scientists
19-1012.00	Food Scientists and Technologists
19-1013.01	Plant Scientists
19-1013.02	Soil Scientists
19-1020.01	Biologists
19-1021.01	Biochemists
19-1021.02	Biophysicists
19-1022.00	Microbiologists
19-1023.00	Zoologists and Wildlife Biologists
19-2011.00	Astronomers
19-2012.00	Physicists
19-2031.00	Chemists
19-2032.00	Materials Scientists
19-2041.00	Environmental Scientists and Specialists, Including Health Geologists
19-2042.01	Geologists
19-2043.00	Hydrologists
19-3041.00	Sociologists
19-3091.01	Anthropologists
19-3091.02	Archeologists
19-3094.00	Political Scientists
19-4011.02	Food Science Technicians
19-4031.00	Chemical Technicians
19-4051.01	Nuclear Equipment Operation Technicians
19-4051.02	Nuclear Monitoring Technicians
19-4091.00	Environmental Science and Protection Technicians, Including Health Forensic Science Technicians
19-4092.00	Forensic Science Technicians
25-4013.00	Museum Technicians and Conservators

<b>Occ Code</b>	<b>Occ Title</b>
29-2091.00	Orthotists and Prosthetists
29-9011.00	Occupational Health and Safety Specialists
45-2011.00	Agricultural Inspectors
51-9082.00	Medical Appliance Technicians
53-6051.01	Aviation Inspectors
<b>Cluster 4 - Design, Entertainment, &amp; Media</b>	
13-1022.00	Wholesale and Retail Buyers, Except Farm Products
13-1071.02	Personnel Recruiters
25-9011.00	Audio-Visual Collections Specialists
27-1011.00	Art Directors
27-1021.00	Commercial and Industrial Designers
27-1022.00	Fashion Designers
27-1025.00	Interior Designers
27-1027.01	Set Designers
27-1027.02	Exhibit Designers
27-2012.02	Directors- Stage, Motion Pictures, Television, and Radio
27-2012.05	Technical Directors/Managers
27-3031.00	Public Relations Specialists
27-4011.00	Audio and Video Equipment Technicians
27-4032.00	Film and Video Editors
41-3011.00	Advertising Sales Agents
	Sales Representatives, Wholesale and Manufacturing, Except Technical
41-4012.00	and Scientific Products
41-9011.00	Demonstrators and Product Promoters
41-9031.00	Sales Engineers
<b>Cluster 5 - Administrative &amp; Finance</b>	
13-1023.00	Purchasing Agents, Except Wholesale, Retail, and Farm Products
13-1031.01	Claims Examiners, Property and Casualty Insurance
13-1031.02	Insurance Adjusters, Examiners, and Investigators
13-1032.00	Insurance Appraisers, Auto Damage
13-2011.01	Accountants
13-2011.02	Auditors
13-2031.00	Budget Analysts
13-2051.00	Financial Analysts
13-2053.00	Insurance Underwriters
13-2081.00	Tax Examiners, Collectors, and Revenue Agents
13-2082.00	Tax Preparers
15-2011.00	Actuaries
23-2011.00	Paralegals and Legal Assistants
23-2092.00	Law Clerks
23-2093.01	Title Searchers
29-2071.00	Medical Records and Health Information Technicians
43-3021.01	Statement Clerks
43-3021.03	Billing, Posting, and Calculating Machine Operators
43-3051.00	Payroll and Timekeeping Clerks
43-3061.00	Procurement Clerks

<b>Occ Code</b>	<b>Occ Title</b>
43-4021.00	Correspondence Clerks
43-4031.01	Court Clerks
43-4031.02	Municipal Clerks
43-4031.03	License Clerks
