

GENETIC ANALYSIS OF LET-23 MEDIATED IP<sub>3</sub> SIGNALING IN  
*CAENORHABDITIS ELEGANS*.

Thesis by  
Yen Kim Bui

In Partial Fulfillment of the Requirements  
for the Degree of  
Doctor of Philosophy

California Institute of Technology

Pasadena, California

2003

## **Acknowledgements**

There have been so many people that have been an important part of this whole experience that I could not imagine how it would have been like without their presence in my life. Most importantly, I thank Paul Sternberg, my advisor. It has truly been a great privilege to work with you. Your passion for things in life and child-like wonder about science have been a constant source of inspiration to me. You have encouraged me to approach things with a level of intensity and thoroughness. You have challenged me always to take things to the next level and have given me enough room to allow my creativity to flourish and my mind to mature scientifically. I really could not have asked for anything more in an advisor. Your unending support have made things much easier throughout the long haul. I look forward to many more interactions in the future.

I also thank my thesis committee members: Ray Deshaies, Scott Fraser, Eliot Meyerowitz, and Erin Schuman. You have all been an example of a scientist to aspire to. Working amongst you in this scientific community has been a great learning experience. I appreciate your comments and support, helping me to make it through to the end. I especially want to thank Scott Fraser for his advice on life in general, and more importantly, for his support throughout a critical time in my graduate career when I was making many decisions about my future. And to Erin, as a woman in science, it has always been encouraging to see you do it all. I only hope that I too can manage the task when the time comes.

Kathy also deserves special mention. A dear friend and mentor, you have taught me a lot. You always seem to keep me in mind and give me valuable advice. I am glad that I will be seeing you at UCLA and will have the continued opportunity for more interactions. There is also Ramzi and Houman, who also share the same

vision; it has been great talking to you about this. Houman, I appreciate your vote of confidence in me. It has meant a lot to me. I will meet up with you for the later part of your training at UCLA!

Former members of the Sternberg lab, Tom Clandinin and Giovanni Lesa, were there from the very beginning when I came to work as a visiting summer student in Paul's lab while I was an undergraduate. Giovanni, you first taught me *C. elegans* biology and a lot more about molecular biology. A few years later, when I arrived as a graduate student, Tom, you have been a tremendous help to me, giving me much advice about genetics. I appreciated your patience and your encouragement. You were on your way out, but what an act to follow. It has been great working with Minqin. When I came into the lab she readily recruited me to join in on her screen.

There have been many since, that presently are in the lab, who have been great for scientific interaction as well as for their friendship and that I would especially like to mention. Rene, you have often provided valuable discussion and perspective on projects. Nadeem, you have incredible focus and a great knowledge of the literature. It has always been good to discuss science with you, among other things. Erich, you are a fountain of knowledge and suggestions. Dave, your antagonism has always kept me on my toes. Keith, you were always available, and our late night discussions were always helpful. Demo has constantly provided support throughout. Allyson, your female presence in the lab has helped evened things out. Jane, you have many a time provided valuable advice about science, and other things in life (like broaching certain topics with Paul). You have a good perspective. It has been fun singing with you and Yvonne too. Lisa, Aidyl and Martha: it was great sharing a room with you. Aidyl, it was incredible being there at one of the most special times of your life, bringing Owen into this world. I will not forget that. Cheryl, you just came, but it

seems like you've already added so much. It has been a wonderful environment working with the rest of the lab. Yvonne, Barbara, Shala, Gladys, and Mary, the tasks you do have helped the lab run smoother.

I especially want to thank Martha for her friendship. You reached out to me at a time when I guess I needed it most. Thank you for your understanding and patience, even when most times I did not have the time to be a great friend. Our friendship has grown throughout the years. My benchmate and housemate, I see you 24 -7 and we still enjoy each other's company. We've been through a lot together and you've been an incredible emotional support through the down points, and I am glad that you too could share in some of the highlights. I am so glad that aside from going through grad school together you could experience Vietnam with me. Our friendship is everlasting.

Prufrock has given me many memories. Special mention goes to Shanti, Tom and Beth, and Jasper, who were also housemates of mine. You are like a second family. And Chi, you have left with me other things essential- that add sparkle to life. And Niki too.

Outside of lab, there were others. Jo, your friendship to me has been very special. Joyce, my former roommate for three years, we had good times. Ying, we are more alike than I like to admit. R.G. showed me how to deal with major setbacks in life with a smile and positive outlook. And D.S. has taught me something very valuable about life and myself. You understood me in ways nobody else could. Life has brought us down different paths, but I will always remember you and treasure your friendship. Brian, Pankaj, Eimear, and Anders: you have made my remaining time here a lot more fun and interesting. John, we will commiserate with each other in the fall. My classmates, you were all very stimulating.

Special thanks to Teresa Strecker, my advisor at Pomona College, who first introduced me to Paul and taught me genetics. A lot of what I learned scientifically that helped me get on my feet when I started grad school, I attribute to my professors at Pomona. It is a very special place.

Finally, I thank my family, whose unconditional love, encouragement, and prayers have brought me this far. Mom, your sacrifice and hard work taught me focus. My dad always taught me since I was young that I could do anything. Thanh, always had supportive words. To my brother, you always believed in me and constantly helped me to keep sight of my goals. In life, I always seemed to be a step behind you, but you made me feel like I was at the front. You always know best. Kim, so many times you have encouraged me and through the roughest (\$%\$\*) times, you were there for me. Dianna, you always managed to make me laugh and smile. There were many times when I was tired, but I made it. Phil 4:13.

## Abstract

Our understanding of signal transduction has increased from the use of genetically tractable organisms combined with biochemical analysis in cell culture. An example is LET-23 receptor tyrosine kinase signaling in *Caenorhabditis elegans*. The epidermal growth factor receptor homolog, LET-23 RTK, mediates multiple functions: development of the male tail, vulva induction, viability, and fertility. One of the ways in which activation of the same receptor can generate a specific response is through distinct signaling pathways downstream. Fertility is mediated by a RAS-independent inositol 1,4,5- triphosphate ( $IP_3$ ) signaling pathway downstream of LET-23 activation.

In this thesis, I take a genetic route to the analysis of  $IP_3$  signaling in *C. elegans*, which mediates ovulation in the fertility pathway. Genetic screens for suppressor or enhancers of mutant phenotypes remain an important tool for dissecting signaling pathways. They can uncover new genes or new mutations in existing genes, which upon analysis, will help us understand more about how that particular protein functions. I describe a genetic screen to identify genes that act to suppress the ovulation/sterility defects associated with both a gain of function in the  $IP_3$  receptor and loss of function in the  $IP_3$  3-kinase. Initial characterization of four suppressors identified is reported. Disruption of genes identified by genome sequencing has allowed us to determine whether a protein is essential for a given response. The importance of regulating  $IP_3$  levels is illustrated by the complexity of kinases and phosphatases that metabolize  $IP_3$ . Nomarski video microscopy analysis shows the *C. elegans*  $IP_3$  3-kinase defective mutant, *lfe-2*, has no ovulation phenotype. Using reverse genetics, I targeted a deletion in the *C. elegans* 5-phosphatase, *ipp-5*, and demonstrate that IPP-5 plays a

critical negative regulatory function for distal spermatheca contraction behavior. Evidence for levels of  $IP_3$  signaling regulating spermatheca contractions which affect fertility, comes from my analysis of multiple mutants that perturb  $IP_3$  signaling. The work presented in this thesis provide the most extensive genetic analysis of  $IP_3$  signaling to date. These results imply thresholds are important for achieving an appropriate response. Finally, I present the genetic characterization of a novel phospholipase C, Ce PLC210, and implicate its critical function for regulating spermatheca-uturine valve contraction behavior. A multitude of proteins is involved in generating a precise biological response.

## Table of Contents

<b>Acknowledgements</b>	iii
<b>Abstract</b>	vii
<b>Chapter 1</b> Receptor tyrosine kinase mediated inositol phosphate signaling	I-1
RTK signaling in <i>C. elegans</i>	I-3
Phosphoinositol metabolism and cell signaling	I-4
Phospholipase C	I-5
The Inositol triphosphate receptor and intracellular IP <sub>3</sub> induced calcium signaling	I-6
Metabolism of IP <sub>3</sub> - A mechanism of negative regulation	I-11
Inositol 3-kinase	I-11
Inositol poly 5-phosphatase	I-12
Genetics of IP <sub>3</sub> signaling	I-13
IP <sub>3</sub> signaling in mice	I-14
IP <sub>3</sub> signaling in yeast	I-15
IP <sub>3</sub> signaling in <i>Drosophila</i>	I-15
IP <sub>3</sub> signaling in <i>C. elegans</i>	I-16
Thesis overview	I-18
References	I-19
Tables and figures	I-31
<b>Chapter 2</b> Suppressors of the ovulation defective sterile mutants due to increased IP <sub>3</sub> signaling	II-1
Introduction	II-2

Material and methods	II-4
Results	II-11
Discussion	II-16
References	II-21
Tables and figures	II-24
<b>Chapter 3</b> <i>C. elegans</i> inositol 5- phosphatase homologue negatively regulates inositol 1,4,5-triphosphate signaling in ovulation	III-1
<b>Chapter 4</b> <i>C. elegans</i> phospholipase C (Ce-PLC-210) mediates Ovulation	IV-1
