

A Attention-deficit assessed using SSAGA- II

B Hyperactivity / impulsivity assessed using SSAGA- II

Supplementary Figure 1.

Sensitivity analyses for abstinence rates according to the presence or absence of attention-deficit or hyperactivity/impulsivity. Graph A: Attention-deficit assessed using the SSAGS-II ($p = 0.0019$, log-rank test; $p = 0.0011$, Wilcoxon test). The number of subjects with attention-deficit was 115, while the number of subjects without attention-deficit was 430.

Graph B: Hyperactivity / impulsivity assessed using the SSAGS-II ($p = 0.5572$, log-rank test; $p = 0.7361$, Wilcoxon test). The number of subjects with hyperactivity / impulsivity was 102, while the number of subjects without hyperactivity / impulsivity was 441.
