## ABSTRACT

We apply the Calderón interpolation methods to Banach lattices of  $p$ -integrable and weakly  $p$ -integrable functions with respect to a Banach-space-valued measure defined on a  $\delta$ -ring. In general, the results we obtain are quite different from those in the case of vector measures on  $\sigma$ -algebras. However, we find a wide class of vector measures on  $\delta$ -rings for which the results on  $\sigma$ -algebras hold true.

## 1. Introduction

For a Banach-space-valued measure  $m$  defined on a  $\sigma$ -algebra, we obtained in [8] the Calderón interpolation spaces  $[X_0, X_1]_{[\theta]}$  and  $[X_0, X_1]^{[\theta]}$  of the couples  $(X_0, X_1)$ , where  $X_0$  and  $X_1$  are the Banach lattices  $L^p(m)$  or  $L_w^p(v)$  of equivalence classes of scalar  $p$ -integrable or, respectively, weakly  $p$ -integrable functions with respect to the measure  $m$ . In such a case, the first method always gives another  $L^p(m)$ -space and the second one yields an  $L_w^p(m)$ -space. More precisely, we obtained (see [8, Theorem 3.4]) for  $1 \leq p_0 \neq p_1 \leq \infty$ ,  $0 < \theta < 1$ , and  $\frac{1}{p} := \frac{1-\theta}{p_0} + \frac{\theta}{p_1}$  the following equalities:

$$\begin{aligned} [L^{p_0}(m), L^{p_1}(m)]_{[\theta]} &\stackrel{(*)}{=} L^p(m), \\ [L_w^{p_0}(m), L_w^{p_1}(m)]_{[\theta]} &\stackrel{(*)}{=} [L^{p_0}(m), L_w^{p_1}(m)]_{[\theta]} \stackrel{(*)}{=} L^p(m), \\ [L_w^{p_0}(m), L_w^{p_1}(m)]_{[\theta]} &\stackrel{(\diamond)}{=} L^p(m), \\ [L^{p_0}(m), L^{p_1}(m)]^{[\theta]} &\stackrel{(\diamond)}{=} L_w^p(m), \\ [L_w^{p_0}(m), L^{p_1}(m)]^{[\theta]} &\stackrel{(\diamond)}{=} [L^{p_0}(m), L_w^{p_1}(m)]^{[\theta]} \stackrel{(\diamond)}{=} L_w^p(m), \\ [L_w^{p_0}(m), L_w^{p_1}(m)]^{[\theta]} &\stackrel{(*)}{=} L_w^p(m). \end{aligned}$$

E-mail addresses: [rcampo@us.es](mailto:rcampo@us.es) (R. del Campo), [afcarri@etsi.us.es](mailto:afcarri@etsi.us.es) (A. Fernández), [mayoral@us.es](mailto:mayoral@us.es) (F. Mayoral), [naranjo@us.es](mailto:naranjo@us.es) (F. Naranjo).

In particular, if the vector measure  $m$  is a (real) positive finite measure  $\mu$  all the previous equalities collapse into the well-known interpolation formulas  $[L^{p_0}(\mu), L^{p_1}(\mu)]_{[\theta]} = [L^{p_0}(\mu), L^{p_1}(\mu)]^{[\theta]} = L^p(\mu)$ . Nevertheless the situation considered in [8] does not include the case

$$[L^{p_0}(\mathbb{R}), L^{p_1}(\mathbb{R})]_{[\theta]} = [L^{p_0}(\mathbb{R}), L^{p_1}(\mathbb{R})]^{[\theta]} = L^p(\mathbb{R}),$$

where the Lebesgue measure in the real line  $\mathbb{R}$  is considered. In order to fill this gap we need to consider a more general structure than a  $\sigma$ -algebra: we must consider vector measures defined on a  $\delta$ -ring. That is the motivation to study the Calderón interpolation methods of Banach lattices of  $p$ -integrable and weakly  $p$ -integrable functions with respect to a Banach-space-valued measure defined on a  $\delta$ -ring. We will see that interpolation results for vector measures on  $\delta$ -rings can be very different from those ones on the context of  $\sigma$ -algebras. Roughly speaking we can say that equalities  $(\star)$  for vector measures on  $\sigma$ -algebras remain true for vector measures on  $\delta$ -rings (see Corollary 3.7), but equalities  $(\diamond)$  for vector measures on  $\sigma$ -algebras cease to be true for vector measures on  $\delta$ -rings (see Example 3.10). However, we will identify a certain type of vector measures on  $\delta$ -rings (called *locally strongly additive* measures) which keep completely the same behavior as in the  $\sigma$ -algebra case for all the different combinations of couples (see Corollaries 4.7 and 4.9).

## 2. Preliminaries

In this section we establish the preliminaries necessary for integration of scalar functions with respect to vector measures on  $\delta$ -rings, in order to make the paper more self-contained and readable. The basic references about integration for us will be [6, 11–13]. Throughout this paper  $\nu : \mathcal{R} \rightarrow X$  will be a vector measure defined on a  $\delta$ -ring  $\mathcal{R}$  of subsets of some nonempty set  $\Omega$  with values in a real Banach space  $X$ . We denote by  $\mathcal{R}^{\text{loc}}$  the  $\sigma$ -algebra of subsets  $A \subseteq \Omega$  such that  $A \cap B \in \mathcal{R}$  for each  $B \in \mathcal{R}$ . The measurability of functions  $f : \Omega \rightarrow \mathbb{R}$  will be considered with respect to the measurable space  $(\Omega, \mathcal{R}^{\text{loc}})$ . The *semivariation* of  $\nu$  is the set function  $\|\nu\| : \mathcal{R}^{\text{loc}} \rightarrow [0, \infty]$  defined by  $\|\nu\|(A) := \sup \{ \|\langle \nu, x^* \rangle\|(A) : x^* \in B(X^*) \}$ , where  $|\langle \nu, x^* \rangle|$  is the variation of the scalar measure

$$\langle \nu, x^* \rangle : A \in \mathcal{R} \longrightarrow \langle \nu, x^* \rangle(A) := \langle \nu(A), x^* \rangle \in \mathbb{R},$$

and  $B(X^*)$  is the unit ball of  $X^*$ , the dual space of  $X$ . A set  $N \in \mathcal{R}^{\text{loc}}$  is called  $\nu$ -null if  $\|\nu\|(N) = 0$ . A property holds  $\nu$ -almost everywhere ( $\nu$ -a.e.) if it holds except on a  $\nu$ -null set.

A measurable function  $f : \Omega \rightarrow \mathbb{R}$  is called *weakly integrable* (with respect to  $\nu$ ) if  $f \in L^1(\langle \nu, x^* \rangle)$  for all  $x^* \in X^*$ . A weakly integrable function  $f$  is said to be *integrable* (with respect to  $\nu$ ) if, for each  $A \in \mathcal{R}^{\text{loc}}$  there exists an element (necessarily unique)  $\int_A f d\nu \in X$ , satisfying

$$\left\langle \int_A f d\nu, x^* \right\rangle = \int_A f d\langle \nu, x^* \rangle, \quad x^* \in X^*.$$

If  $1 \leq p < \infty$ , a measurable function  $f : \Omega \rightarrow \mathbb{R}$  is called *weakly  $p$ -integrable* with respect to  $\nu$  if  $|f|^p$  is weakly integrable (with respect to  $\nu$ ) and  *$p$ -integrable* (with respect to  $\nu$ ) if  $|f|^p$  is integrable with respect to  $\nu$ . The space  $L_w^p(\nu)$  of all ( $\nu$ -a.e. equivalence classes of) weakly  $p$ -integrable functions becomes a Banach lattice when endowed with the usual order  $\nu$ -a.e. and the norm

$$\|f\|_{L_w^p(\nu)} := \sup \left\{ \left( \int_{\Omega} |f|^p d\|\nu, x^*\| \right)^{\frac{1}{p}} : x^* \in B(X^*) \right\}.$$

The *Fatou property* holds in  $L_w^p(\nu)$ , meaning that if  $(f_n)_n$  is a positive increasing sequence in  $L_w^p(\nu)$  converging pointwise  $\nu$ -a.e. to a function  $f$  and  $\sup_n \|f_n\|_{L_w^p(\nu)} < \infty$ , then  $f \in L_w^p(\nu)$ , and  $\|f\|_{L_w^p(\nu)} = \sup_n \|f_n\|_{L_w^p(\nu)}$ . Moreover, the space  $L^p(\nu)$  of all ( $\nu$ -a.e. equivalence classes of)  $p$ -integrable functions is a closed *order continuous* ideal of  $L_w^p(\nu)$ . In fact, it is the closure of  $\mathcal{S}(\mathcal{R})$ , the space of simple functions supported on  $\mathcal{R}$ . Recall that order continuity means that if  $(f_n)_n$  is a positive increasing sequence in  $L^p(\nu)$  converging pointwise  $\nu$ -a.e. to a function  $f \in L^p(\nu)$ , then  $\|f - f_n\|_{L_w^p(\nu)} \rightarrow 0$ . The Banach lattices  $L^p(\nu)$  and  $L_w^p(\nu)$  of equivalence classes of scalar  $p$ -integrable and weakly  $p$ -integrable functions were initially studied in [7] for vector measures  $\nu$  on a  $\sigma$ -algebra and its basic properties can be extended and remain true for vector measures on  $\delta$ -rings. Also we can find in [14, Chapter 3] a very good material about spaces of integrable functions with respect to a vector measure on a  $\sigma$ -algebra. Finally, let us consider two more spaces strongly related with the spaces of  $p$ -integrable functions with respect to a vector measure. Denote by  $L^\infty(\nu)$  the space of classes of essentially bounded measurable functions  $f : \Omega \rightarrow \mathbb{R}$  with the essential supremum norm. Consider also the vector space  $L^0(\nu)$  of all classes of measurable functions  $f : \Omega \rightarrow \mathbb{R}$ . If the vector measure  $\nu$  is defined on a  $\sigma$ -algebra it is well-known (see [7, Corollary 3.2]) that the following inclusions hold for all  $p > 1$

$$L^\infty(\nu) \subseteq L^p(\nu) \subseteq L_w^p(\nu) \subseteq L^1(\nu) \subseteq L_w^1(\nu) \subseteq L^0(\nu), \quad (1)$$

and all of them are continuous inclusions, where the topology of *convergence in measure* is considered on  $L^0(\nu)$ . As it is well-known, this topology is generated by the complete  $F$ -norm  $\left\| \frac{|f|}{1+|f|} \right\|_{L_w^1(\nu)}$ , where  $f \in L^0(\nu)$ . When the vector measure  $\nu$  is

defined on a  $\delta$ -ring instead of a  $\sigma$ -algebra, the inclusions (1) are in general false, but we can save something. For each  $A \in \mathcal{R}$  consider the  $\sigma$ -algebra  $\Sigma_A := \{E \in \mathcal{R} : E \subseteq A\}$  of subsets of  $A$  and the vector measure  $m_A : E \in \Sigma_A \longrightarrow m_A(E) = \nu(E) \in X$ , that is, the restriction of  $\nu$  to  $A$ . Note that  $|\langle m_A, x^* \rangle|(E) = |\langle \nu, x^* \rangle|(E)$  for all  $x^* \in X^*$  and  $E \in \Sigma_A$ . In particular,  $\|m_A\|(E) = \|\nu\|(E)$  for all  $E \in \Sigma_A$ . Moreover, if  $1 \leq p < \infty$  and  $f \in L_w^p(\nu)$  it is not difficult to check that

$$\int_A |f \chi_A|^p d|\langle m_A, x^* \rangle| = \int_\Omega |f \chi_A|^p d|\langle \nu, x^* \rangle|, \quad x^* \in X^*,$$

and so  $f \chi_A \in L_w^p(m_A)$  and  $\|f \chi_A\|_{L_w^p(m_A)} = \|f \chi_A\|_{L_w^p(\nu)}$ . Moreover, if  $f \in L^1(\nu)$ , in which case  $f \chi_A \in L^1(\nu)$ , and  $E \in \Sigma_A$ , then

$$\left\langle \int_E f \chi_A dm_A, x^* \right\rangle = \int_E f \chi_A d\langle \nu, x^* \rangle = \int_E f \chi_A d\langle m_A, x^* \rangle, \quad x^* \in X^*,$$

and  $f \chi_A \in L^1(m_A)$ .

**Lemma 2.1.** *If  $f \in L_w^p(\nu)$ , with  $p > 1$ , and  $A \in \mathcal{R}$ , then  $f \chi_A \in L^1(\nu)$ . Moreover,  $\|f \chi_A\|_{L_w^1(\nu)} \leq (\|\nu\|(A))^{\frac{1}{q}} \|f\|_{L_w^p(\nu)}$ , where  $q$  is the conjugate exponent of  $p$ .*

**Proof.** Given  $A \in \mathcal{R}$ , and  $f \in L_w^p(\nu)$ , with  $p > 1$  we know that  $f \chi_A \in L_w^p(m_A)$ . Now by applying (1) we obtain  $f \chi_A \in L_w^p(m_A) \subseteq L^1(m_A)$ . Now the Hölder inequality gives  $\|f \chi_A\|_{L_w^1(m_A)} \leq \|f \chi_A\|_{L_w^p(m_A)} (\|m_A\|(A))^{\frac{1}{q}}$ , that is,  $\|f \chi_A\|_{L_w^1(\nu)} \leq \|f \chi_A\|_{L_w^p(\nu)} (\|\nu\|(A))^{\frac{1}{q}} \leq \|f\|_{L_w^p(\nu)} (\|\nu\|(A))^{\frac{1}{q}}$ .  $\square$

### 3. Interpolation for general vector measures

We wish to apply Calderón's two methods of complex interpolation to couples of Banach lattices  $L^p(\nu)$  and  $L_w^p(\nu)$ . Since these methods are defined only for Banach spaces over the complex field  $\mathbb{C}$  we must in fact apply them to the couple of *complexifications* of those spaces concerning complex valued functions  $f : \Omega \longrightarrow \mathbb{C}$  and vector measures with values in complex Banach spaces. If  $\nu : \mathcal{R} \rightarrow X$  is a vector measure defined on a  $\delta$ -ring  $\mathcal{R}$  of subsets of  $\Omega$  with values into a complex Banach space  $X$  we can define the spaces  $L_w^p(\nu)$  and  $L^p(\nu)$ , with  $1 \leq p < \infty$ , analogously as we did in the previous section for the case of a real Banach space. Moreover, following a standard argument (see [8, Section 2]) we can see that  $L_w^p(\nu)$  and  $L^p(\nu)$  are *complex Banach lattices*, that is,

$$\begin{aligned} L_w^p(\nu) &= \{f : \Omega \longrightarrow \mathbb{C} : \operatorname{Re}(f), \operatorname{Im}(f) \in L_w^p(\nu_{\mathbb{R}})\}, \\ L^p(\nu) &= \{f : \Omega \longrightarrow \mathbb{C} : \operatorname{Re}(f), \operatorname{Im}(f) \in L^p(\nu_{\mathbb{R}})\}, \end{aligned}$$

where  $\operatorname{Re}(f)$  and  $\operatorname{Im}(f)$  are, respectively, the real and imaginary parts of  $f$ , and  $\nu_{\mathbb{R}} : A \in \mathcal{R} \longrightarrow \nu_{\mathbb{R}}(A) := \nu(A) \in X_{\mathbb{R}}$ , where  $X_{\mathbb{R}}$  denotes  $X$  considered as a vector space over  $\mathbb{R}$ , in which case  $X_{\mathbb{R}}$  is a real Banach space. Then a function  $f \in L_w^p(\nu)$  (respectively  $L^p(\nu)$ ) if and only if its modulus  $|f| \in L_w^p(\nu)$  (respectively  $L^p(\nu)$ ). This means that in the proofs of the interpolation results of this paper it suffices to consider only nonnegative real functions. We refer to [2,4,5] for general results concerning interpolation.

In what follows we will always consider vector measures  $\nu : \mathcal{R} \rightarrow X$  which are  $\sigma$ -finite, that is, there exist a pairwise disjoint sequence  $(\Omega_k)_k$  in  $\mathcal{R}$  and a  $\nu$ -null set  $N \in \mathcal{R}^{\text{loc}}$ , such that  $\Omega = (\cup_{k \geq 1} \Omega_k) \cup N$ . There is some connection between  $\sigma$ -finite vector measures defined on  $\delta$ -rings and vector measures defined on  $\sigma$ -algebras. The first ones always appear as densities  $\nu_g$  of a certain measurable function  $g$  with respect to a measure  $\nu$  defined on a  $\sigma$ -algebra, as we describe in the following example. In fact, the example is a natural procedure to construct vector measures on  $\delta$ -rings coming from vector measures on  $\sigma$ -algebras. See [6, Theorem 3.3].

**Example 3.1.** Let  $(\Omega, \Sigma)$  be a measurable space, and  $m : \Sigma \rightarrow X$  a vector measure with values in a Banach space  $X$ . For a strictly positive measurable function  $g : \Omega \longrightarrow \mathbb{R}$  consider the  $\delta$ -ring  $\mathcal{R}_g := \{A \in \Sigma : g \cdot \chi_A \in L^1(m)\}$ , where  $L^1(m)$  is the space of integrable functions with respect to the measure  $m$ . We shall denote by  $\nu_g$  the measure with density  $g$  with respect to  $m$ , that is, the vector measure defined by  $\nu_g : A \in \mathcal{R}_g \longrightarrow \nu_g(A) := \int_A g dm \in X$ . Note that  $\mathcal{R}_g^{\text{loc}} = \Sigma$ , and so  $\mathcal{R}_g$  coincides with (not only a  $\delta$ -ring) the  $\sigma$ -algebra  $\Sigma$ , if and only if  $g \in L^1(m)$ . Therefore, measurability and (since  $g$  is strictly positive) equality  $\nu_g$ -a.e. and  $m$ -a.e. coincide. Moreover, the  $L^p$ -spaces ( $1 \leq p < \infty$ ) associated with this measure  $\nu_g$  can be easily described in terms of the ones of the measure  $m$ . Namely,

$$\begin{aligned} L_w^p(\nu_g) &= \{f \in L^0(m) : |f|^p \cdot g \in L_w^1(m)\}, \\ L^p(\nu_g) &= \{f \in L^0(m) : |f|^p \cdot g \in L^1(m)\}, \end{aligned}$$

with the norm  $\|f\|_{L_w^p(\nu_g)} = \| |f|^p \cdot g \|_{L_w^1(m)}^{\frac{1}{p}}$ , for all  $f \in L_w^p(\nu_g)$ . Furthermore,

- (A) If  $g$  is bounded from above, then  $L_w^p(m) \subseteq L_w^p(\nu_g)$ , and similarly  $L^p(m) \subseteq L^p(\nu_g)$ , both with continuous inclusions.
- (B) If  $g$  is bounded from below, then  $L_w^p(\nu_g) \subseteq L_w^p(m)$ , and analogously  $L^p(\nu_g) \subseteq L^p(m)$ , both with continuous inclusions.

The first step for interpolation is to check that each pair of spaces  $L_w^p(\nu)$  or  $L^p(\nu)$ , where  $\nu : \mathcal{R} \rightarrow X$  is a  $\sigma$ -finite vector measure, forms a *compatible couple of Banach spaces*, that is, they are imbedded continuously in the same topological vector space. In our case the environment space will be the linear space  $L^0(\nu)$  of all ( $\nu$ -a.e. equivalence classes of) real measurable functions  $f$  defined on  $\Omega$ , endowed with the topology generated by certain  $F$ -norm  $\|\cdot\|_{L^0(\nu)}$  which we shall now describe. Consider the decomposition  $\Omega = (\cup_{k \geq 1} \Omega_k) \cup N$ , where  $(\Omega_k)_k$  is a pairwise disjoint sequence in  $\mathcal{R}$ , and  $N$  is a  $\nu$ -null set in  $\mathcal{R}^{\text{loc}}$ . For each  $k = 1, 2, \dots$  consider the  $\sigma$ -algebra  $\Sigma_k := \{A \in \mathcal{R} : A \subseteq \Omega_k\}$  of subsets of  $\Omega_k$  and the vector measure

$$m_k : A \in \Sigma_k \longrightarrow m_k(A) = \nu(A) \in X,$$

that is, the restriction of  $\nu$  to  $\Omega_k$ . Note that  $\|m_k\|(A) = \|\nu\|(A)$  for all  $A \in \Sigma_k$ , and consequently a set  $B \in \mathcal{R}^{\text{loc}}$  is  $\nu$ -null if and only if  $B \cap \Omega_k$  is  $m_k$ -null for all  $k = 1, 2, \dots$ . Now define

$$\|f\|_{L^0(\nu)} := \sum_{k=1}^{\infty} \frac{1}{2^k (1 + \|\nu\|(\Omega_k))} \left\| \frac{|f|}{1 + |f|} \chi_{\Omega_k} \right\|_{L_w^1(m_k)}, \quad f \in L^0(\nu).$$

Note that  $\frac{|f|}{1 + |f|} \chi_{\Omega_k} \in L^\infty(m_k) \subseteq L^1(m_k)$  for all  $k = 1, 2, \dots$ .

**Lemma 3.2.** *Let  $(f_n)_n$  be a sequence in  $L^0(\nu)$ . The following assertions are equivalent:*

- (1)  $\|f_n\|_{L^0(\nu)} \rightarrow 0$  as  $n \rightarrow \infty$ .
- (2)  $f_n \rightarrow 0$ , as  $n \rightarrow \infty$ , in  $m_k$ -measure on  $\Omega_k$  for all  $k = 1, 2, \dots$ .

**Proof.** The implication (1)  $\Rightarrow$  (2) follows from the inequality

$$\left\| \frac{|f|}{1 + |f|} \chi_{\Omega_k} \right\|_{L_w^1(m_k)} \leq 2^k (1 + \|\nu\|(\Omega_k)) \|f\|_{L^0(\nu)}, \quad f \in L^0(\nu), \quad k = 1, 2, \dots$$

For the converse implication (2)  $\Rightarrow$  (1) take an arbitrary  $\varepsilon > 0$  and let  $k_0$  such that  $\sum_{k > k_0} 2^{-k} < \frac{\varepsilon}{2}$ . Now using the hypothesis (2) choose  $n_0$  such that  $\left\| \frac{|f_n|}{1 + |f_n|} \chi_{\Omega_k} \right\|_{L_w^1(m_k)} \leq \frac{2^{k-1}(1 + \|\nu\|(\Omega_k))\varepsilon}{k_0}$  for all  $n \geq n_0$  and  $k = 1, 2, \dots, k_0$ . Then  $\|f_n\|_{L^0(\nu)} < \varepsilon$  for all  $n \geq n_0$ .  $\square$

**Lemma 3.3.**  $\|\cdot\|_{L^0(\nu)}$  is an  $F$ -norm, and  $(L^0(\nu), \|\cdot\|_{L^0(\nu)})$  is a complete metric linear space.

**Proof.** (i)  $\|f\|_{L^0(\nu)} = 0$  if and only if  $f = 0$   $\nu$ -a.e. If  $\|f\|_{L^0(\nu)} = 0$ , then  $\left\| \frac{|f|}{1 + |f|} \chi_{\Omega_k} \right\|_{L_w^1(m_k)} = 0$  for all  $k = 1, 2, \dots$  and hence  $f = 0$  on  $\Omega_k$   $m_k$ -a.e. for all  $k = 1, 2, \dots$ . Now take into account the comment above the definition of  $\|\cdot\|_{L^0(\nu)}$  to conclude that  $f = 0$   $\nu$ -a.e.

Since the function  $t \in [0, \infty) \rightarrow \frac{t}{1+t} \in [0, \infty)$  is increasing the next properties follow:

- (ii)  $\|\alpha f\|_{L^0(\nu)} \leq \|f\|_{L^0(\nu)}$  if  $|\alpha| \leq 1$  and  $f \in L^0(\nu)$ , and
- (iii)  $\|f + g\|_{L^0(\nu)} \leq \|f\|_{L^0(\nu)} + \|g\|_{L^0(\nu)}$  for all  $f, g \in L^0(\nu)$ .

Next let us see that

- (iv)  $\|\alpha_n f\|_{L^0(\nu)} \rightarrow 0$  if  $f \in L^0(\nu)$  and  $\alpha_n \rightarrow 0$ .

Indeed, if  $(\alpha_n)_n$  is a sequence of scalars with  $\alpha_n \rightarrow 0$ , then  $\frac{|\alpha_n f|}{1 + |\alpha_n f|} \chi_{\Omega_k}$  converges pointwise to 0 on  $\Omega_k$   $m_k$ -a.e. for all  $k = 1, 2, \dots$ . The order continuity of the space  $L^1(\nu_k)$  means that  $\left\| \frac{|\alpha_n f|}{1 + |\alpha_n f|} \chi_{\Omega_k} \right\|_{L_w^1(m_k)} \rightarrow 0$  for all  $k = 1, 2, \dots$ . Thus

**Lemma 3.2** assures that  $\|\alpha_n f\|_{L^0(\nu)} \rightarrow 0$  as  $n \rightarrow \infty$ .

Finally, from the inequality  $\|\alpha f\|_{L^0(\nu)} \leq \max\{1, |\alpha|\} \|f\|_{L^0(\nu)}$ , where  $f \in L^0(\nu)$  and  $\alpha \in \mathbb{R}$ , it follows that

- (v)  $\|\alpha f_n\|_{L^0(\nu)} \rightarrow 0$  if  $\alpha \in \mathbb{R}$  and  $\|f_n\|_{L^0(\nu)} \rightarrow 0$ .

Properties (i)–(v) mean that  $\|\cdot\|_{L^0(\nu)}$  is an  $F$ -norm on  $L^0(\nu)$ . Finally we are going to check that  $(L^0(\nu), \|\cdot\|_{L^0(\nu)})$  is complete.

Take a Cauchy sequence  $(f_n)_n$  in  $L^0(\nu)$ . Then, for every  $k = 1, 2, \dots$ ,  $\left( \frac{|f_n|}{1 + |f_n|} \chi_{\Omega_k} \right)_n$  is a Cauchy sequence in the Banach space  $L^1(m_k)$ . Thus for every  $k = 1, 2, \dots$  there exists  $g_k \in L^1(m_k)$  such that  $\left\| g_k - \frac{|f_n|}{1 + |f_n|} \chi_{\Omega_k} \right\|_{L_w^1(m_k)} \rightarrow 0$  as  $n \rightarrow \infty$ . Define pointwise the function  $g := \sum_{k \geq 1} g_k \in L^0(\nu)$  and conclude that  $\|g - f_n\|_{L^0(\nu)} \rightarrow 0$ , as  $n \rightarrow \infty$ , with the same argument as in **Lemma 3.2**.  $\square$

**Lemma 3.4.** For all  $p \geq 1$ , the space  $L_w^p(\nu)$  is continuously included into  $L^0(\nu)$ .

**Proof.** If  $f \in L_w^1(\nu)$ , then  $\left\| \frac{|f|}{1+|f|} \chi_{\Omega_k} \right\|_{L_w^1(\nu)} \leq \|f \chi_{\Omega_k}\|_{L_w^1(\nu)} \leq \|f\|_{L_w^1(\nu)}$  for all  $k = 1, 2, \dots$  and  $\|f\|_{L^0(\nu)} \leq \|f\|_{L_w^1(\nu)}$ . If  $f \in L_w^p(\nu)$ , with  $p > 1$ , Lemma 2.1 assures that  $f \chi_{\Omega_k} \in L^1(\nu)$  for all  $k = 1, 2, \dots$  and then  $\left\| \frac{|f|}{1+|f|} \chi_{\Omega_k} \right\|_{L_w^1(\nu)} \leq \|f \chi_{\Omega_k}\|_{L_w^1(\nu)} \leq \|f\|_{L_w^p(\nu)} (\| \nu \|(\Omega_k))^{1/q}$ , where  $q > 1$  is the conjugate exponent of  $p$ . Thus

$$\begin{aligned} \|f\|_{L^0(\nu)} &:= \sum_{k=1}^{\infty} \frac{1}{2^k (1 + \| \nu \|(\Omega_k))} \left\| \frac{|f|}{1+|f|} \chi_{\Omega_k} \right\|_{L_w^1(\nu)} \\ &\leq \sum_{k=1}^{\infty} \frac{(\| \nu \|(\Omega_k))^{1/q}}{2^k (1 + \| \nu \|(\Omega_k))} \|f\|_{L_w^p(\nu)} \leq \|f\|_{L_w^p(\nu)}. \quad \square \end{aligned}$$

The key to obtaining the  $(\star)$ -formulas for the interpolated spaces is the Calderón–Lozanovskii's product space. Let us now recall the basic properties of this space that we can see in [4]. Let  $\nu : \mathcal{R} \rightarrow X$  be a  $\sigma$ -finite vector measure. For a given couple  $(X_0, X_1)$  of Banach lattice ideals of  $L^0(\nu)$  and  $0 \leq \theta \leq 1$ , the Calderón–Lozanovskii's product space  $X_0^{1-\theta} X_1^\theta$  is the Banach space of all  $(\nu$ -a.e. equivalence classes of) scalar measurable functions  $f \in L^0(\nu)$  such that there exist  $f_0 \in B_1(X_0)$ ,  $f_1 \in B_1(X_1)$  and  $\lambda > 0$  for which

$$|f(w)| \leq \lambda |f_0(w)|^{1-\theta} |f_1(w)|^\theta, \quad w \in \Omega \quad (\nu\text{-a.e.}) \quad (2)$$

endowed with the norm  $\|f\|_{X_0^{1-\theta} X_1^\theta} = \inf \lambda$ , where the infimum is taken over those  $\lambda$  satisfying (2). The Calderón–Lozanovskii's product space has the following relationships to the Calderón interpolation spaces.

(CL1)  $X_0 \cap X_1 \subseteq [X_0, X_1]_{[\theta]} \subseteq X_0^{1-\theta} X_1^\theta \subseteq [X_0, X_1]^{[\theta]} \subseteq X_0 + X_1$ . Moreover we have equality of norms (see [1, Theorem]), that is,

$$\|x\|_{[X_0, X_1]_{[\theta]}} = \|x\|_{X_0^{1-\theta} X_1^\theta} = \|x\|_{[X_0, X_1]^{[\theta]}}, \quad x \in [X_0, X_1]_{[\theta]}. \quad (3)$$

(CL2) If  $X_0$  or  $X_1$  is order continuous, then  $[X_0, X_1]_{[\theta]} = X_0^{1-\theta} X_1^\theta$ .

(CL3) If  $X_0$  and  $X_1$  have the Fatou property then  $[X_0, X_1]^{[\theta]} = X_0^{1-\theta} X_1^\theta$ .

Let us compute the Calderón–Lozanovskii's products of spaces of  $p$ -integrable functions. The key is the following result.

**Proposition 3.5.** Let  $1 < p, q < \infty$  be conjugate exponents. Then

- (i)  $\mathcal{S}(\mathcal{R}) \cdot L_w^p(\nu) \subseteq L^1(\nu)$ .
- (ii)  $L_w^p(\nu) \cdot L_w^q(\nu) = L_w^1(\nu)$ , with  $\|fg\|_{L_w^1(\nu)} \leq \|f\|_{L_w^p(\nu)} \|g\|_{L_w^q(\nu)}$ .
- (iii)  $L^p(\nu) \cdot L^q(\nu) = L^p(\nu) \cdot L_w^q(\nu) = L^1(\nu)$ .

**Proof.** (i) This inclusion follows from Lemma 2.1, because functions in  $\mathcal{S}(\mathcal{R})$  are linear combinations of characteristic functions of subsets in  $\mathcal{R}$ .

(ii) Let  $f \in L_w^p(\nu)$ ,  $g \in L_w^q(\nu)$ . The Hölder inequality gives  $fg \in L^1(|\langle \nu, x^* \rangle|)$ , for all  $x^* \in X^*$ , and moreover, if  $x^* \in B(X^*)$ , then

$$\int_{\Omega} |fg| d|\langle \nu, x^* \rangle| \leq \|f\|_{L^p(|\langle \nu, x^* \rangle|)} \|g\|_{L^q(|\langle \nu, x^* \rangle|)} \leq \|f\|_{L_w^p(\nu)} \|g\|_{L_w^q(\nu)}.$$

Therefore,  $fg \in L^1(\nu)$  with  $\|fg\|_{L_w^1(\nu)} \leq \|f\|_{L_w^p(\nu)} \|g\|_{L_w^q(\nu)}$ . Conversely, if  $0 \leq h \in L_w^1(\nu)$  then  $h = h^{\frac{1}{p}} h^{\frac{1}{q}}$ , with  $h^{\frac{1}{p}} \in L_w^p(\nu)$  and  $h^{\frac{1}{q}} \in L_w^q(\nu)$ .

(iii) Clearly,  $L^1(\nu) \subseteq L^p(\nu) \cdot L^q(\nu) \subseteq L^p(\nu) \cdot L_w^q(\nu)$ . Let  $f \in L^p(\nu)$ , and  $g \in L_w^q(\nu)$ . There exists  $(s_n)_n \subseteq \mathcal{S}(\mathcal{R})$  such that  $s_n \rightarrow f$  in  $L^p(\nu)$ . From (i), it follows that  $(s_n g)_n \subseteq L^1(\nu)$ . Moreover,

$$\|fg - s_n g\|_{L_w^1(\nu)} = \|(f - s_n)g\|_{L_w^1(\nu)} \leq \|f - s_n\|_{L_w^p(\nu)} \|g\|_{L_w^q(\nu)} \rightarrow 0,$$

which yields  $(s_n g)_n \rightarrow fg$  in  $L_w^1(\nu)$ . Since  $L^1(\nu)$  is closed in  $L_w^1(\nu)$  we conclude that  $fg \in L^1(\nu)$ .  $\square$

As we mentioned above, Proposition 3.5 allows us to compute the Calderón–Lozanovskii's product spaces of several couples of  $L^p$  and  $L_w^p$ -spaces.

**Corollary 3.6.** Let  $1 \leq p_0 < p_1 < \infty$ ,  $0 < \theta < 1$ , and  $\frac{1}{p} = \frac{1-\theta}{p_0} + \frac{\theta}{p_1}$ . Then

- (i)  $L^{p_0}(\nu)^{1-\theta} L^{p_1}(\nu)^\theta = L^p(\nu)$ .
- (ii)  $L_w^{p_0}(\nu)^{1-\theta} L_w^{p_1}(\nu)^\theta = L^{p_0}(\nu)^{1-\theta} L_w^{p_1}(\nu)^\theta = L^p(\nu)$ .
- (iii)  $L_w^{p_0}(\nu)^{1-\theta} L_w^{p_1}(\nu)^\theta = L_w^p(\nu)$ .

**Proof.** It is enough to observe that  $\frac{p_0}{(1-\theta)p}$  and  $\frac{p_1}{\theta p}$  are conjugate exponents. Now, apply Proposition 3.5.  $\square$

From Corollary 3.6, and equalities described in (CL2) and (CL3), it follows that

**Corollary 3.7.** If  $1 \leq p_0 < p_1 < \infty$ ,  $0 < \theta < 1$ , and  $\frac{1}{p} = \frac{1-\theta}{p_0} + \frac{\theta}{p_1}$ , then

$$\begin{aligned} [L^{p_0}(\nu), L^{p_1}(\nu)]_{[\theta]} &= [L_w^{p_0}(\nu), L^{p_1}(\nu)]_{[\theta]} = [L^{p_0}(\nu), L_w^{p_1}(\nu)]_{[\theta]} = L^p(\nu), \\ [L_w^{p_0}(\nu), L_w^{p_1}(\nu)]^{[\theta]} &= L_w^p(\nu). \end{aligned}$$

The simplest example of a  $\sigma$ -finite vector measure on a  $\delta$ -ring is given by a  $\sigma$ -finite measure space  $(\Omega, \Sigma, \mu)$  if we consider the measure  $\mu$  defined on the  $\delta$ -ring of measurable subsets of finite measure. For example, consider the Lebesgue measure  $\lambda$  on the  $\sigma$ -algebra  $\mathcal{M}$  of Lebesgue measurable subsets of the real line  $\mathbb{R}$ . Let  $\mathcal{R} := \{A \in \mathcal{M} : \lambda(A) < \infty\}$  and define the vector measure  $\nu : A \in \mathcal{R} \longrightarrow \nu(A) = \lambda(A) \in \mathbb{R}$ . Then  $L_w^p(\nu) = L^p(\nu) = L^p(\mathbb{R})$  for all  $p \geq 1$  and Corollary 3.7 assures that

$$[L^{p_0}(\mathbb{R}), L^{p_1}(\mathbb{R})]_{[\theta]} = [L^{p_0}(\mathbb{R}), L^{p_1}(\mathbb{R})]^{[\theta]} = L^p(\mathbb{R}),$$

as we have mentioned in the introduction.

**Remark 3.8.** Let  $1 \leq p_0 < p < p_1 < \infty$ . From (CL1) and the above corollary we obtain the following inclusions:

- (i)  $L_w^{p_0}(\nu) \cap L_w^{p_1}(\nu) \subseteq L_w^p(\nu) \subseteq L_w^{p_0}(\nu) + L_w^{p_1}(\nu)$ .
- (ii)  $L^{p_0}(\nu) \cap L^{p_1}(\nu) \subseteq L^p(\nu) \subseteq L^{p_0}(\nu) + L^{p_1}(\nu)$ .
- (iii)  $L^{p_0}(\nu) \cap L_w^{p_1}(\nu) \subseteq L^p(\nu) \subseteq L^{p_0}(\nu) + L_w^{p_1}(\nu)$ .
- (iv)  $L_w^{p_0}(\nu) \cap L^{p_1}(\nu) \subseteq L^p(\nu) \subseteq L_w^{p_0}(\nu) + L^{p_1}(\nu)$ .

Each of them assures that the corresponding space that is in the middle of the inclusions is an *intermediate space*. Nevertheless, for a general vector measure  $\nu$  on a  $\delta$ -ring and  $p_0 < p < p_1$ , the space  $L^p(\nu)$  does not need to be an intermediate space of the couple  $(L_w^{p_0}(\nu), L_w^{p_1}(\nu))$  because in some cases  $L_w^{p_0}(\nu) \cap L_w^{p_1}(\nu) \not\subseteq L^p(\nu)$ . Analogously the space  $L_w^p(\nu)$  does not need to be an intermediate space of the couple  $(L^{p_0}(\nu), L^{p_1}(\nu))$  because in such cases  $L_w^p(\nu) \not\subseteq L^{p_0}(\nu) + L^{p_1}(\nu)$ . The following example illustrates the above statements.

**Example 3.9.** Let  $\mathcal{R}$  be the  $\delta$ -ring of finite subsets of natural numbers  $\mathbb{N}$ , and consider the  $\sigma$ -finite vector measure  $\nu : A \in \mathcal{R} \longrightarrow \nu(A) := \chi_A \in c_0(\mathbb{N})$ , where  $c_0(\mathbb{N})$  is the space of null sequences. For every  $1 \leq p < \infty$ , it is easy to check that  $L_w^p(m) = \ell^\infty(\mathbb{N})$ , the space of bounded sequences, and  $L^p(m) = c_0(\mathbb{N})$ . In what follows it will be interesting to know that  $\|\nu\|(A) = 1$ , for every nonempty  $A \subseteq \mathbb{N}$ , and  $\|\nu\|(\emptyset) = 0$ .

As we noted in the introduction, if  $\nu$  is a vector measure over a  $\sigma$ -algebra, then it is known that, in addition to the equalities established in the above Corollary 3.7, the following equalities hold  $[L_w^{p_0}(\nu), L_w^{p_1}(\nu)]_{[\theta]} = L^p(\nu)$  and  $[L^{p_0}(\nu), L^{p_1}(\nu)]^{[\theta]} = [L_w^{p_0}(\nu), L^{p_1}(\nu)]^{[\theta]} = [L^{p_0}(\nu), L_w^{p_1}(\nu)]^{[\theta]} = L_w^p(\nu)$ . Nevertheless, the situation can be completely different in  $\delta$ -rings as the next example shows.

**Example 3.10.** Consider the vector measure  $\nu$  of Example 3.9. For every  $1 \leq p < \infty$ , we know that  $L_w^p(\nu) = \ell^\infty(\mathbb{N})$ , and also  $L^p(\nu) = c_0(\mathbb{N})$ . Thus, for all  $1 \leq p_0 < p < p_1 < \infty$ , we have

$$\begin{aligned} [L_w^{p_0}(\nu), L_w^{p_1}(\nu)]_{[\theta]} &= [\ell^\infty(\mathbb{N}), \ell^\infty(\mathbb{N})]_{[\theta]} = \ell^\infty(\mathbb{N}) = L_w^p(\nu), \\ [L^{p_0}(\nu), L^{p_1}(\nu)]^{[\theta]} &= [c_0(\mathbb{N}), c_0(\mathbb{N})]^{[\theta]} = c_0(\mathbb{N}) = L^p(\nu). \end{aligned}$$

But there are cases where the situation is similar to the case of  $\sigma$ -algebras even for measures genuinely defined on  $\delta$ -rings.

**Example 3.11.** With the same notation of the previous examples, let us consider now the vector measure (defined on the same  $\delta$ -ring  $\mathcal{R}$ )

$$\nu : A \in \mathcal{R} \longrightarrow \nu(A) := \alpha \cdot \chi_A \in c_0(\mathbb{N}),$$

where  $\alpha = (\alpha_n)_n$  is the sequence given by  $\alpha_n = n$ , for all  $n = 1, 2, \dots$ . It is easy to check, for all  $1 \leq p < \infty$ , that

$$\begin{aligned} L_w^p(\nu) &= \ell^\infty\left(\alpha^{\frac{1}{p}}\right) := \left\{(a_n)_n : \left(n^{\frac{1}{p}} a_n\right)_n \in \ell^\infty(\mathbb{N})\right\}, \\ L^p(\nu) &= c_0\left(\alpha^{\frac{1}{p}}\right) := \left\{(a_n)_n : \left(n^{\frac{1}{p}} a_n\right)_n \in c_0(\mathbb{N})\right\}. \end{aligned}$$

In this case, we get the  $(\diamond)$ -formulas, that is, for all  $1 \leq p_0 < p_1 < \infty$  and  $0 < \theta < 1$ , we have

$$[L_w^{p_0}(\nu), L_w^{p_1}(\nu)]_{[\theta]} = L^p(\nu), \tag{4}$$

and

$$[L^{p_0}(\nu), L^{p_1}(\nu)]^{[\theta]} = [L_w^{p_0}(\nu), L_w^{p_1}(\nu)]^{[\theta]} = [L^{p_0}(\nu), L_w^{p_1}(\nu)]^{[\theta]} = L_w^p(\nu), \quad (5)$$

where  $\frac{1}{p} := \frac{1-\theta}{p_0} + \frac{\theta}{p_1}$ . Let us see how to obtain equality (4). The proof of equalities (5) must be postponed until [Corollary 4.9](#) because we do not know an easy computation to obtain them. To prove equality (4) it is enough to have in mind the following:

- (A)  $c_0(\alpha^{\frac{1}{p}}) \subseteq \ell^\infty(\alpha^{\frac{1}{p}}) \subseteq c_0(\alpha^{\frac{1}{q}}) \subseteq \ell^\infty(\alpha^{\frac{1}{q}})$ ,  $1 \leq p < q < \infty$ .  
 (B)  $\overline{\ell^\infty(\alpha^{\frac{1}{p}})}^{\ell^\infty(\alpha^{\frac{1}{q}})} = c_0(\alpha^{\frac{1}{q}})$ ,  $1 \leq p < q < \infty$ .  
 (C)  $(\ell^\infty(\alpha^{\frac{1}{p_0}}))^{1-\theta} (c_0(\alpha^{\frac{1}{p_1}}))^\theta = c_0(\alpha^{\frac{1}{p}})$  (cf. [Corollary 3.6\(ii\)](#)).

Then, taking into account [2, Theorem 4.2.2(b)],

$$\begin{aligned} [L_w^{p_0}(\nu), L_w^{p_1}(\nu)]_{[\theta]} &= [\ell^\infty(\alpha^{\frac{1}{p_0}}), \ell^\infty(\alpha^{\frac{1}{p_1}})]_{[\theta]} = \left[ \ell^\infty(\alpha^{\frac{1}{p_0}}), \overline{\ell^\infty(\alpha^{\frac{1}{p_0}})}^{\ell^\infty(\alpha^{\frac{1}{p_1}})} \right]_{[\theta]} \\ &= [\ell^\infty(\alpha^{\frac{1}{p_0}}), c_0(\alpha^{\frac{1}{p_1}})]_{[\theta]} = (\ell^\infty(\alpha^{\frac{1}{p_0}}))^{1-\theta} (c_0(\alpha^{\frac{1}{p_1}}))^\theta \\ &= c_0(\alpha^{\frac{1}{p}}) = L^p(\nu). \end{aligned}$$

Let us mention for this measure that for every  $A \subseteq \mathbb{N}$  we have  $\|\nu\|(A) = \max A$  if  $A$  is finite, and  $\|\nu\|(A) = \infty$  if  $A$  is infinite.

#### 4. Interpolation for locally strongly additive measures

As we have seen in [Example 3.9](#), for a  $\sigma$ -finite vector measure  $\nu$  on a  $\delta$ -ring and  $p_0 < p < p_1$ , the space  $L^p(\nu)$  does not need to be an intermediate space of the couple  $(L_w^{p_0}(\nu), L_w^{p_1}(\nu))$ . However, there is a broad class of vector measures for which this occurs: locally strongly additive vector measures (see [Theorem 4.5](#)). Recall that a vector measure  $\nu : \mathcal{R} \rightarrow X$  is called *locally strongly additive* if  $\lim_{n \rightarrow \infty} \|\nu(A_n)\|_X = 0$  for all disjoint sequences  $(A_n)_n$  in  $\mathcal{R}$  such that  $\|\nu\|(\bigcup_{n \geq 1} A_n) < \infty$ . This concept of locally strong additivity differs a bit from that of Brooks and Dinculeanu [3], where *locally* means that the property is satisfied inside a set of the  $\delta$ -ring  $\mathcal{R}$  instead of a measurable set of finite semivariation. Note that the vector measure we have considered in the previous [Example 3.11](#) is locally strongly additive, but the vector measure we considered in [Example 3.9](#) is not locally strongly additive. In what follows we continue with a  $\sigma$ -finite vector measure  $\nu : \mathcal{R} \rightarrow X$ .

**Lemma 4.1.** *Let  $B \in \mathcal{R}^{\text{loc}}$ . Then*

- (1)  $\chi_B \in L_w^1(\nu)$  if and only if  $\|\nu\|(B) < \infty$ .  
 (2)  $\chi_B \in L^1(\nu)$  if and only if  $\lim_{n \rightarrow \infty} \|\nu(A_n)\| = 0$  for all disjoint sequences  $(A_n)_n$  in  $\mathcal{R}$  such that  $A_n \subseteq B$ , for all  $n = 1, 2, \dots$ .

Moreover, the following conditions are equivalent:

- (A)  $\nu$  is locally strongly additive.  
 (B) If  $B \in \mathcal{R}^{\text{loc}}$  and  $\chi_B \in L_w^1(\nu)$ , then  $\chi_B \in L^1(\nu)$ .  
 (C) There is no set  $B \in \mathcal{R}^{\text{loc}}$  such that  $\chi_B \in L_w^1(\nu) \setminus L^1(\nu)$ .

**Proof.** (1) If  $B \in \mathcal{R}^{\text{loc}}$ , it is enough to note that

$$\|\nu\|(B) = \sup \{ |\langle \nu, x^* \rangle| : x^* \in B(X^*) \} = \|\chi_B\|_{L_w^1(\nu)}.$$

(2) Suppose  $\chi_B \in L^1(\nu)$  and let  $(A_n)_n \subseteq \mathcal{R}$  be a pairwise disjoint sequence such that  $A_n \subseteq B$ , for all  $n = 1, 2, \dots$ . Denote by  $A := \bigcup_{n \geq 1} A_n$ . Then  $\chi_A \leq \chi_B$ , and so  $\chi_A \in L^1(\nu)$ . Moreover, the order continuity of  $L^1(\nu)$  implies that  $\sum_{n \geq 1} \chi_{A_n} = \chi_A$  in  $L^1(\nu)$ , so  $\|\nu(A_n)\| \leq \|\chi_{A_n}\|_{L_w^1(\nu)} \rightarrow 0$ , as  $n \rightarrow \infty$ . Reciprocally, suppose that  $\lim_{n \rightarrow \infty} \|\nu(A_n)\| = 0$  for all pairwise disjoint sequences  $(A_n)_n$  in  $\mathcal{R}$  such that  $A_n \subseteq B$ , for all  $n = 1, 2, \dots$ . This means that the vector measure  $\nu_B : A \in \mathcal{R} \rightarrow \nu_B(A) := \nu(B \cap A) \in X$  is strongly additive, which is equivalent to  $\chi_\Omega \in L^1(\nu_B)$  (see [6, Corollary 3.2(b)]). Moreover, for a function  $f \in L^0(\nu)$  it is not difficult to check that  $f \in L^1(\nu_B)$  if and only if  $f \chi_B \in L^1(\nu)$ . Thus,  $\chi_B \in L^1(\nu)$  and the equivalence is over.

Finally note that (C) is a reformulation of (B) and the equivalence between (A) and (B) follows by applying characterizations (1) and (2).  $\square$

**Notation 4.2.** In what follows it will be convenient to consider the following notation. For a nonnegative measurable function  $f : \Omega \rightarrow \mathbb{R}$ , and two real numbers  $0 < a < b$ , consider the three disjoint measurable subsets of  $\Omega$

$$\begin{aligned} [f < a] &:= \{w \in \Omega : 0 \leq f(w) < a\} \in \mathcal{R}^{\text{loc}}, \\ [a \leq f \leq b] &:= \{w \in \Omega : a \leq f(w) \leq b\} \in \mathcal{R}^{\text{loc}}, \quad \text{and} \\ [f > b] &:= \{w \in \Omega : f(w) > b\} \in \mathcal{R}^{\text{loc}}. \end{aligned}$$

The next two lemmas will be useful in what follows.

**Lemma 4.3.** Let  $1 \leq p_0 < p < p_1 < \infty$ .

- (1) If  $0 \leq f \in L_w^p(\nu)$ , then  
 (i)  $f \chi_{[f > b]} \in L_w^{p_0}(\nu)$ , and  $\lim_{b \rightarrow \infty} \|f \chi_{[f > b]}\|_{L_w^{p_0}(\nu)} = 0$ .  
 (ii)  $f \chi_{[f < a]} \in L_w^{p_1}(\nu)$ , and  $\lim_{a \rightarrow 0} \|f \chi_{[f < a]}\|_{L_w^{p_1}(\nu)} = 0$ .  
 (2) If  $0 \leq f \in L_w^{p_0}(\nu) \cap L_w^{p_1}(\nu)$ , then

$$\lim_{b \rightarrow \infty} \|f \chi_{[f > b]}\|_{L_w^p(\nu)} = \lim_{a \rightarrow 0} \|f \chi_{[f < a]}\|_{L_w^p(\nu)} = 0.$$

**Proof.** (1i) Note that  $f^{p_0} \chi_{[f > b]} = f^p f^{p_0-p} \chi_{[f > b]} \leq \frac{1}{b^{p-p_0}} f^p \chi_{[f > b]} \in L_w^1(\nu)$ , which means that  $f \chi_{[f > b]} \in L_w^{p_0}(\nu)$ . Taking norm in the above inequalities we have

$$\|f \chi_{[f > b]}\|_{L_w^{p_0}(\nu)} \leq b^{p_0-p} \|f^p \chi_{[f > b]}\|_{L_w^1(\nu)} \leq b^{p_0-p} \|f^p\|_{L_w^1(\nu)} \rightarrow 0,$$

as  $b \rightarrow \infty$ , that is,  $\lim_{b \rightarrow \infty} \|f \chi_{[f > b]}\|_{L_w^{p_0}(\nu)} = 0$ .

- (1ii) In that case  $f^{p_1} \chi_{[f < a]} = f^p f^{p_1-p} \chi_{[f < a]} \leq a^{p_1-p} f^p \chi_{[f < a]} \in L_w^1(\nu)$ , so we have  $f \chi_{[f < a]} \in L_w^{p_1}(\nu)$ . Now, taking norm

$$\|f^{p_1} \chi_{[f < a]}\|_{L_w^1(\nu)} \leq a^{p_1-p} \|f^p \chi_{[f < a]}\|_{L_w^1(\nu)} \rightarrow 0,$$

as  $a \rightarrow 0$ , that is,  $\lim_{a \rightarrow 0} \|f \chi_{[f < a]}\|_{L_w^{p_1}(\nu)} = 0$ .

- (2) According to Remark 3.8 the function  $f \in L_w^p(\nu)$  and so the functions  $f^p \chi_{[f < a]}$  and  $f^p \chi_{[f > b]}$  belong to  $L_w^1(\nu)$  too. Moreover, using the above arguments we have

$$\begin{aligned} \|f^p \chi_{[f < a]}\|_{L_w^1(\nu)} &\leq a^{p-p_0} \|f^{p_0} \chi_{[f < a]}\|_{L_w^1(\nu)} \leq a^{p-p_0} \|f^{p_0}\|_{L_w^1(\nu)}, \\ \|f^p \chi_{[f > b]}\|_{L_w^1(\nu)} &\leq b^{p-p_1} \|f^{p_1} \chi_{[f > b]}\|_{L_w^1(\nu)} \leq b^{p-p_1} \|f^{p_1}\|_{L_w^1(\nu)}, \end{aligned}$$

that is,  $\lim_{b \rightarrow \infty} \|f \chi_{[f > b]}\|_{L_w^p(\nu)} = \lim_{a \rightarrow 0} \|f \chi_{[f < a]}\|_{L_w^p(\nu)} = 0$ .  $\square$

**Lemma 4.4.** Let  $0 \leq f \in L^0(\nu)$ ,  $1 \leq p_0 < p_1 < \infty$ , and  $0 \leq a < b$ .

- (A) If  $f \chi_{[a \leq f \leq b]} \in L_w^{p_0}(\nu) + L_w^{p_1}(\nu)$ , then  $f \chi_{[a \leq f \leq b]} \in L_w^{p_0}(\nu) \cap L_w^{p_1}(\nu)$ .  
 (B) If  $f \chi_{[a \leq f \leq b]} \in L^{p_0}(\nu) + L^{p_1}(\nu)$ , then  $f \chi_{[a \leq f \leq b]} \in L^{p_0}(\nu) \cap L^{p_1}(\nu)$ .

**Proof.** (A) Assume that  $f \chi_{[a \leq f \leq b]}$  belongs to  $L_w^{p_0}(\nu) + L_w^{p_1}(\nu)$ , so there exist  $0 \leq f_0 \in L_w^{p_0}(\nu)$  and  $0 \leq f_1 \in L_w^{p_1}(\nu)$  such that  $f \chi_{[a \leq f \leq b]} = f_0 + f_1$ . On the one hand note that  $f_0^{p_1} \leq b^{p_1-p_0} f_0^{p_0}$  since  $f_0 \leq f \chi_{[a \leq f \leq b]} \leq b$ . Therefore,

$$f^{p_1} \chi_{[a \leq f \leq b]} = (f_0 + f_1)^{p_1} \leq 2^{p_1} (f_0^{p_1} + f_1^{p_1}) \leq 2^{p_1} (b^{p_1-p_0} f_0^{p_0} + f_1^{p_1}) \in L_w^1(\nu),$$

which proves that  $f \chi_{[a \leq f \leq b]} \in L_w^{p_1}(\nu)$ . In order to prove that  $f \chi_{[a \leq f \leq b]}$  also belongs to  $L_w^{p_0}(\nu)$ , consider the disjoint sets of  $\mathcal{R}^{\text{loc}}$

$$\begin{aligned} D &:= \{u \in [a \leq f \leq b] : f_0(u) \leq f_1(u)\}, \\ E &:= \{u \in [a \leq f \leq b] : f_1(u) < f_0(u)\}, \end{aligned}$$

and observe that

$$f = f_0 + f_1 = (f_0 + f_1) \chi_D + (f_0 + f_1) \chi_E \leq 2f_1 \chi_D + 2f_0 \chi_E,$$

and also that  $f_1 \chi_D \geq \frac{a}{2}$  since  $a \leq f \chi_D \leq 2f_1 \chi_D$ . Thus,

$$f^{p_0} \chi_{[a \leq f \leq b]} \leq 2^{p_0} f_1^{p_0} \chi_D + 2^{p_0} f_0^{p_0} \chi_E \leq \frac{2^{p_1}}{a^{p_1-p_0}} f_1^{p_1} \chi_D + 2^{p_0} f_0^{p_0} \chi_E \in L_w^1(\nu),$$

which proves that  $f \chi_{[a \leq f \leq b]} \in L^{p_0}(\nu)$ .

- (B) The proof is similar to (A).  $\square$

**Theorem 4.5.** Let  $1 \leq p_0 < p_1 < \infty$ . The following are equivalent:

- (i)  $\nu$  is locally strongly additive.
- (ii)  $L_w^{p_0}(\nu) \cap L_w^{p_1}(\nu) \subseteq L^p(\nu)$ , for some/all  $p_0 < p < p_1$ .
- (iii)  $L_w^p(\nu) \subseteq L^{p_0}(\nu) + L^{p_1}(\nu)$ , for some/all  $p_0 < p < p_1$ .

**Proof.** (i)  $\Rightarrow$  (ii) Let  $p_0 < p < p_1$  and take  $0 \leq f \in L_w^{p_0}(\nu) \cap L_w^{p_1}(\nu)$ . Let us consider the sets  $[f < \frac{1}{n}]$ ,  $[\frac{1}{n} \leq f \leq n]$ , and  $[f > n]$ , for all  $n = 1, 2, \dots$ . As we know, all these sets are in  $\mathcal{R}^{\text{loc}}$  since  $f$  is measurable. According to Remark 3.8,  $f \in L_w^p(\nu)$  and so the functions  $f^p \chi_{[f < \frac{1}{n}]}$ ,  $f^p \chi_{[\frac{1}{n} \leq f \leq n]}$ , and  $f^p \chi_{[f > n]}$  belong to  $L_w^1(\nu)$ , for all  $n = 1, 2, \dots$ . From the inequalities

$$\frac{1}{n^p} \chi_{[\frac{1}{n} \leq f \leq n]} \leq f^p \chi_{[\frac{1}{n} \leq f \leq n]} \leq n^p \chi_{[\frac{1}{n} \leq f \leq n]}, \quad n = 1, 2, \dots \quad (6)$$

we conclude that  $\chi_{[\frac{1}{n} \leq f \leq n]} \in L_w^1(\nu)$ , for all  $n = 1, 2, \dots$ . By the hypothesis and Lemma 4.1 we get  $\chi_{[\frac{1}{n} \leq f \leq n]} \in L^1(\nu)$ , for all  $n = 1, 2, \dots$ . But, applying again inequalities (6) we obtain that  $f^p \chi_{[\frac{1}{n} \leq f \leq n]} \in L^1(\nu)$ , for all  $n \in \mathbb{N}$ . On the other hand, Lemma 4.3 assures that

$$\lim_{n \rightarrow \infty} \|f^p \chi_{[f < \frac{1}{n}]}\|_{L_w^1(\nu)} = \lim_{n \rightarrow \infty} \|f^p \chi_{[f > n]}\|_{L_w^1(\nu)} = 0,$$

and therefore,

$$\|f^p - f^p \chi_{[\frac{1}{n} \leq f \leq n]}\|_{L_w^1(\nu)} \leq \|f^p \chi_{[f < \frac{1}{n}]}\|_{L_w^1(\nu)} + \|f^p \chi_{[f > n]}\|_{L_w^1(\nu)} \rightarrow 0,$$

when  $n \rightarrow \infty$ , which says that  $\left(f^p \chi_{[\frac{1}{n} \leq f \leq n]}\right)_n$  converges to  $f^p$  in  $L_w^1(\nu)$ . Hence,  $f^p$  must be in  $L^1(\nu)$  (or equivalently  $f \in L^p(\nu)$ ), since  $L^1(\nu)$  is closed in  $L_w^1(\nu)$ .

(ii)  $\Rightarrow$  (iii) Let  $p_0 < p < p_1$  and assume that  $L_w^{p_0}(\nu) \cap L_w^{p_1}(\nu) \subseteq L^p(\nu)$ . Let us see that  $L_w^p(\nu) \subseteq L^{p_0}(\nu) + L^{p_1}(\nu)$ . Let  $0 \leq f \in L_w^p(\nu)$  and consider again the sets  $[f < \frac{1}{n}]$ ,  $[\frac{1}{n} \leq f \leq n]$ , and  $[f > n]$  for  $n = 1, 2, \dots$ . By applying Lemma 4.3 we obtain  $f \chi_{[f < \frac{1}{n}]} \in L_w^{p_0}(\nu)$ ,  $f \chi_{[f > n]} \in L_w^{p_1}(\nu)$ , and moreover

$$\lim_{n \rightarrow \infty} \|f \chi_{[f < \frac{1}{n}]}\|_{L_w^{p_0}(\nu)} = \lim_{n \rightarrow \infty} \|f \chi_{[f > n]}\|_{L_w^{p_1}(\nu)} = 0. \quad (7)$$

As  $L_w^p(\nu) \subseteq L_w^{p_0}(\nu) + L_w^{p_1}(\nu)$ , Lemma 4.4 leads to

$$f \chi_{[\frac{1}{n} \leq f \leq n]} \in L_w^{p_0}(\nu) \cap L_w^{p_1}(\nu), \quad n = 1, 2, \dots \quad (8)$$

From (7) and (8) we obtain also that

$$\|f - f \chi_{[\frac{1}{n} \leq f \leq n]}\|_{L_w^{p_0}(\nu) + L_w^{p_1}(\nu)} \leq \|f \chi_{[f < \frac{1}{n}]}\|_{L_w^{p_0}(\nu)} + \|f \chi_{[f > n]}\|_{L_w^{p_1}(\nu)} \rightarrow 0,$$

when  $n \rightarrow \infty$ , which says that the sequence  $\left(f \chi_{[\frac{1}{n} \leq f \leq n]}\right)_n$  converges to  $f$  in  $L_w^{p_0}(\nu) + L_w^{p_1}(\nu)$ . If  $\left(f \chi_{[\frac{1}{n} \leq f \leq n]}\right)_n$  were a Cauchy sequence in  $L^{p_0}(\nu) + L^{p_1}(\nu)$ , then  $f$  would be in  $L^{p_0}(\nu) + L^{p_1}(\nu)$  and this would finish the proof. First note that  $f \chi_{[\frac{1}{n} \leq f \leq n]} \in L^{p_0}(\nu) + L^{p_1}(\nu)$  for  $n = 1, 2, \dots$ . This follows from (8), the hypothesis  $L_w^{p_0}(\nu) \cap L_w^{p_1}(\nu) \subseteq L^p(\nu)$ , and Remark 3.8(ii). Thus, we have to check for natural numbers  $k < n$  that

$$\lim_{k \rightarrow \infty} \|f \chi_{[\frac{1}{n} \leq f \leq n]} - f \chi_{[\frac{1}{k} \leq f \leq k]}\|_{L_w^{p_0}(\nu) + L_w^{p_1}(\nu)} = 0.$$

Let  $k, n \in \mathbb{N}$ , with  $k < n$ . Since

$$\begin{aligned} f \chi_{[\frac{1}{n} \leq f \leq n]} - f \chi_{[\frac{1}{k} \leq f \leq k]} &= f \chi_{[\frac{1}{n} \leq f \leq n] \cap [f < \frac{1}{k}]} + f \chi_{[\frac{1}{n} \leq f \leq n] \cap [f > k]} \\ &= f \chi_{[\frac{1}{n} \leq f < \frac{1}{k}]} + f \chi_{[k < f \leq n]}, \end{aligned}$$

then, having in mind (7) we conclude that

$$\begin{aligned} \left\| f \chi_{\left[\frac{1}{n} \leq f \leq n\right]} - f \chi_{\left[\frac{1}{k} \leq f \leq k\right]} \right\|_{L_w^{p_0}(\nu) + L_w^{p_1}(\nu)} &\leq \left\| f \chi_{\left[\frac{1}{n} \leq f < \frac{1}{k}\right]} \right\|_{L_w^{p_0}(\nu)} + \left\| f \chi_{\{k < f \leq n\}} \right\|_{L_w^{p_1}(\nu)} \\ &\leq \left\| f \chi_{\left[f < \frac{1}{k}\right]} \right\|_{L_w^{p_0}(\nu)} + \left\| f \chi_{\{k < f\}} \right\|_{L_w^{p_1}(\nu)} \rightarrow 0, \end{aligned}$$

as  $k \rightarrow \infty$ .

(iii)  $\Rightarrow$  (i) Let  $B \in \mathcal{R}^{\text{loc}}$  such that  $\chi_B \in L_w^1(\nu)$ . Then  $\chi_B \in L_w^p(\nu)$ , and by the hypothesis  $\chi_B \in L^{p_0}(\nu) + L^{p_1}(\nu)$ , that is,  $\chi_B = f_0 + f_1$  for some  $f_0 \in L^{p_0}(\nu)$  and  $f_1 \in L^{p_1}(\nu)$ . We can choose  $f_0, f_1 \geq 0$  and so  $\sup\{f_0, f_1\} \leq 1$ . Since  $f_0^{p_0}, f_1^{p_1} \in L^1(\nu)$  and  $f_0^{p_1} \leq f_0^{p_0}$  we have

$$\chi_B = (\chi_B)^{p_1} = (f_0 + f_1)^{p_1} \leq 2^{p_1}(f_0^{p_1} + f_1^{p_1}) \leq 2^{p_1}(f_0^{p_0} + f_1^{p_1}) \in L^1(\nu).$$

Therefore  $\chi_B \in L^1(\nu)$ , and Lemma 4.1 ensures that  $\nu$  is locally strongly additive.  $\square$

**Remark 4.6.** In relation to the proof of the above implication (ii)  $\Rightarrow$  (iii) let us mention the following comment. If  $Y_0$  and  $Y_1$  are Banach spaces and  $X_0 \subseteq Y_0$  and  $X_1 \subseteq Y_1$  are closed subspaces, in general  $X_0 + X_1 \subseteq Y_0 + Y_1$  is not a closed subspace of the sum. Even more, the sum of two closed subspaces of a Hilbert space need not be closed.

Let us see what happens when  $L^p(\nu)$  is an intermediate space of the couple  $(L_w^{p_0}(\nu), L_w^{p_1}(\nu))$  as is described in Theorem 4.5.

**Corollary 4.7.** Let  $1 \leq p_0 < p_1 < \infty$ . The following are equivalent:

- (1)  $\nu$  is locally strongly additive.
- (2)  $[L_w^{p_0}(\nu), L_w^{p_1}(\nu)]_{[\theta]} = L^p(\nu)$ , where  $0 < \theta < 1$ , and  $\frac{1}{p} = \frac{1-\theta}{p_0} + \frac{\theta}{p_1}$ .

**Proof.** (1)  $\Rightarrow$  (2) Applying Theorem 4.5 and Corollary 3.7, we have

$$\begin{aligned} L_w^{p_0}(\nu) \cap L_w^{p_1}(\nu) &\subseteq L^p(\nu) = [L_w^{p_0}(\nu), L_w^{p_1}(\nu)]_{[\theta]} \subseteq [L_w^{p_0}(\nu), L_w^{p_1}(\nu)]_{[\theta]} \\ &\subseteq [L_w^{p_0}(\nu), L_w^{p_1}(\nu)]^{[\theta]} = L_w^p(\nu). \end{aligned}$$

On the other hand, the norm in  $L^p(\nu)$  is the restriction of the norm in  $[L_w^{p_0}(\nu), L_w^{p_1}(\nu)]_{[\theta]}$ , because  $L^p(\nu)$  and  $L_w^p(\nu)$  have the same norm, and as we know from (3) the norm in  $[L_w^{p_0}(\nu), L_w^{p_1}(\nu)]_{[\theta]}$  is the restriction of the norm of  $[L_w^{p_0}(\nu), L_w^{p_1}(\nu)]^{[\theta]}$ . Being  $L^p(\nu)$  a Banach space it is closed in  $[L_w^{p_0}(\nu), L_w^{p_1}(\nu)]_{[\theta]}$ , and we get the equality  $L^p(\nu) = [L_w^{p_0}(\nu), L_w^{p_1}(\nu)]_{[\theta]}$  because  $L_w^{p_0}(\nu) \cap L_w^{p_1}(\nu)$  is dense in  $[L_w^{p_0}(\nu), L_w^{p_1}(\nu)]_{[\theta]}$  (see [2, Theorem 4.2.2]).

The implication (2)  $\Rightarrow$  (1) follows clearly from Theorem 4.5, because the inclusion  $L_w^{p_0}(\nu) \cap L_w^{p_1}(\nu) \subseteq [L_w^{p_0}(\nu), L_w^{p_1}(\nu)]_{[\theta]}$  holds for all  $0 < \theta < 1$ .  $\square$

The key to obtaining the missing  $(\diamond)$ -formulas for the interpolated spaces is the Gustavsson–Peetre's method. Let us now recall briefly this method. Its detailed description appears in [9]. For a given couple  $(X_0, X_1)$  of Banach spaces and  $0 < \theta < 1$ , the Gustavsson–Peetre space  $\langle X_0, X_1, \theta \rangle$  is the Banach space of those elements  $x \in X_0 + X_1$  for which there exists a sequence  $(x_k)_{k \in \mathbb{Z}}$  of elements of  $x_k \in X_0 \cap X_1$  such that

(GP1)  $x = \sum_{k \in \mathbb{Z}} x_k$ , where the series converges in  $X_0 + X_1$ , and

(GP2) there exists  $C > 0$  such that for every finite subset  $F \subset \mathbb{Z}$  and every real sequence  $(\varepsilon_k)_{k \in F}$  with  $|\varepsilon_k| \leq 1$  we have

$$\left\| \sum_{k \in F} \frac{\varepsilon_k}{2^{k\theta}} x_k \right\|_{X_0} \leq C, \text{ and } \left\| \sum_{k \in F} \frac{\varepsilon_k}{2^{k(\theta-1)}} x_k \right\|_{X_1} \leq C.$$

We equip  $\langle X_0, X_1, \theta \rangle$  with the norm  $\|x\|_{\langle X_0, X_1, \theta \rangle} = \inf C$ , where the inf is taken over all sequences  $(x_k)_{k \in \mathbb{Z}}$  permissible in (GP1) and (GP2). The relation of the Gustavsson–Peetre's interpolation space and the Calderón interpolation spaces is given (see [10, Theorem 5 and Section 7]) by the continuous inclusion

$$\langle X_0, X_1, \theta \rangle \subseteq [X_0, X_1]^{[\theta]}. \quad (\text{GP3})$$

**Corollary 4.8.** Let  $1 \leq p_0 < p_1 < \infty$ . The following are equivalent:

- (1)  $\nu$  is locally strongly additive.
- (2)  $L_w^p(\nu) \subseteq \langle L^{p_0}(\nu), L^{p_1}(\nu), \theta \rangle$ , where  $0 < \theta < 1$ , and  $\frac{1}{p} = \frac{1-\theta}{p_0} + \frac{\theta}{p_1}$ .

**Proof.** (1)  $\Rightarrow$  (2) Let  $0 < \theta < 1$ ,  $\frac{1}{p} = \frac{1-\theta}{p_0} + \frac{\theta}{p_1}$ , and put

$$c := 2^{\frac{-(1-\theta)p_1}{p_1-p}} = 2^{\frac{-\theta p_0}{p-p_0}} < 1.$$

Take an arbitrary function  $0 \leq f \in L_w^p(v)$  and for all  $k \in \mathbb{Z}$ , define  $f_k := f \chi_{[c^k \leq f < c^{k-1}]}$ , which belongs to  $L_w^p(v)$ . Since  $v$  is locally strongly additive, by [Theorem 4.5](#) we have that  $f, f_k \in L^{p_0}(v) + L^{p_1}(v)$ , and applying [Lemma 4.4](#) it follows that  $f_k \in L^{p_0}(v) \cap L^{p_1}(v)$ . We are going to check conditions (GP1) and (GP2) for the function  $f$  and the sequence  $(f_k)_{k \in \mathbb{Z}}$ .

(GP1) First note that  $f = \sum_{k \in \mathbb{Z}} f_k$  pointwise. Then, given  $i < j \in \mathbb{Z}$ , we have by applying [Lemma 4.3](#)

$$\begin{aligned} \left\| f - \sum_{k=i}^j f_k \right\|_{L^{p_0}(v) + L^{p_1}(v)} &= \|f \chi_{[f \geq c^{i-1}]} + f \chi_{[f \leq c^j]}\|_{L^{p_0}(v) + L^{p_1}(v)} \\ &\leq \|f \chi_{[f \geq c^{i-1}]} \|_{L_w^{p_0}(v)} + \|f \chi_{[f < c^j]}\|_{L_w^{p_1}(v)} \rightarrow 0, \end{aligned}$$

when  $i \rightarrow -\infty$  and  $j \rightarrow \infty$ , that is,  $f = \sum_{k \in \mathbb{Z}} f_k$  in  $L^{p_0}(v) + L^{p_1}(v)$ .

(GP2) Let  $F \subseteq \mathbb{Z}$  be a finite set and  $(\varepsilon_k)_{k \in F}$  with  $|\varepsilon_k| \leq 1$ . Keeping in mind that  $f_k^{p_0} \leq c^{k(p_0-p)} f_k^p$  and also that  $f_k^{p_1} \leq c^{(k-1)(p_1-p)} f_k^p$ , we obtain, on the one hand

$$\begin{aligned} \left\| \sum_{k \in F} \frac{\varepsilon_k}{2^{k\theta}} f_k \right\|_{L_w^{p_0}(v)}^{p_0} &\leq \left\| \sum_{k \in F} \frac{1}{2^{k\theta p_0}} f_k^{p_0} \right\|_{L_w^1(v)} \leq \left\| \sum_{k \in F} \frac{c^{k(p_0-p)}}{2^{k\theta p_0}} f_k^p \right\|_{L_w^1(v)} \\ &= \left\| \sum_{k \in F} f_k^p \right\|_{L_w^1(v)} \leq \|f\|_{L_w^p(v)}^p, \end{aligned}$$

and on the other hand

$$\begin{aligned} \left\| \sum_{k \in F} \frac{\varepsilon_k}{2^{k(\theta-1)}} f_k \right\|_{L_w^{p_1}(v)}^{p_1} &\leq \left\| \sum_{k \in F} \frac{1}{2^{k(\theta-1)p_1}} f_k^{p_1} \right\|_{L_w^1(v)} \leq \left\| \sum_{k \in F} \frac{c^{(k-1)(p_1-p)}}{2^{k(\theta-1)p_1}} f_k^p \right\|_{L_w^1(v)} \\ &= \left\| \sum_{k \in F} f_k^p \right\|_{L_w^1(v)} \leq \|f\|_{L_w^p(v)}^p. \end{aligned}$$

Therefore, taking  $C = \max \left\{ \|f\|_{L_w^p(v)}^{\frac{p}{p_0}}, \|f\|_{L_w^p(v)}^{\frac{p}{p_1}} \right\}$  the implication is over.

The implication (2)  $\Rightarrow$  (1) is clear from [Theorem 4.5](#), because the inclusion  $\langle L^{p_0}(v), L^{p_1}(v), \theta \rangle \subseteq L^{p_0}(v) + L^{p_1}(v)$  holds for all  $0 < \theta < 1$ .  $\square$

**Corollary 4.9.** Let  $1 \leq p_0 < p_1 < \infty$ . The following are equivalent:

- (1)  $v$  is locally strongly additive.
- (2)  $[L^{p_0}(v), L^{p_1}(v)]^{[\theta]} = [L_w^{p_0}(v), L^{p_1}(v)]^{[\theta]} = [L^{p_0}(v), L_w^{p_1}(v)]^{[\theta]} = L_w^p(v)$ , where  $0 < \theta < 1$ , and  $\frac{1}{p} = \frac{1-\theta}{p_0} + \frac{\theta}{p_1}$ .

**Proof.** (1)  $\Rightarrow$  (2) Let  $0 < \theta < 1$  and  $\frac{1}{p} = \frac{1-\theta}{p_0} + \frac{\theta}{p_1}$ . By applying the property (GP3), [Corollaries 4.8](#) and [3.7](#), we have

$$\begin{aligned} L_w^p(v) &\subseteq \langle L^{p_0}(v), L^{p_1}(v), \theta \rangle \subseteq [L^{p_0}(v), L^{p_1}(v)]^{[\theta]} \\ &\subseteq [L_w^{p_0}(v), L^{p_1}(v)]^{[\theta]} \subseteq [L_w^{p_0}(v), L_w^{p_1}(v)]^{[\theta]} = L_w^p(v). \end{aligned}$$

In the above chain of inclusions we can change the space  $[L_w^{p_0}(v), L^{p_1}(v)]^{[\theta]}$  by the other one  $[L^{p_0}(v), L_w^{p_1}(v)]^{[\theta]}$ . This gives the desired equalities.

The implication (2)  $\Rightarrow$  (1) is clear from [Theorem 4.5](#), because the inclusion  $[L^{p_0}(v), L^{p_1}(v)]^{[\theta]} \subseteq L^{p_0}(v) + L^{p_1}(v)$  holds for all  $0 < \theta < 1$ .  $\square$

**Remark 4.10.** After [Corollary 4.9](#) we can retrieve equalities (5) of [Example 3.11](#) because the measure considered there was locally strongly additive. In particular, with the same notation as in [Example 3.11](#), we obtain

$$\left\langle c_0 \left( \alpha^{\frac{1}{p_0}} \right), c_0 \left( \alpha^{\frac{1}{p_1}} \right), \theta \right\rangle = \left[ c_0 \left( \alpha^{\frac{1}{p_0}} \right), c_0 \left( \alpha^{\frac{1}{p_1}} \right) \right]^{[\theta]} = \ell^\infty \left( \alpha^{\frac{1}{p}} \right). \quad (9)$$

**Remark 4.11.** Given  $1 \leq p_0 < p_1 < \infty$ ,  $0 < \theta < 1$ , and a  $\sigma$ -finite vector measure  $v : \mathcal{R} \rightarrow X$ , [Corollary 3.7](#) tells us that the smallest space of the list of all possible Calderón interpolated spaces is  $L^p(v) = [L^{p_0}(v), L^{p_1}(v), ]_{[\theta]}$ , and the biggest one

is  $[L_w^{p_0}(v), L_w^{p_1}(v)]^{[\theta]} = L_w^p(v)$ , where  $\frac{1}{p} := \frac{1-\theta}{p_0} + \frac{\theta}{p_1}$ . Then any other Calderón interpolated space must be laid between  $L^p(v)$  and  $L_w^p(v)$ . We have seen that the method  $[\cdot, \cdot]_{[\theta]}$  always produces an  $L^p$ -space whereas the method  $[\cdot, \cdot]^{[\theta]}$  always produces an  $L_w^p$ -space, of course under the hypothesis that  $v$  is locally strongly additive. Without this assumption the spaces  $[L_w^{p_0}(v), L_w^{p_1}(v)]_{[\theta]}$  and  $[L^{p_0}(v), L^{p_1}(v)]^{[\theta]}$  can be strictly located between  $L^p(v)$  and  $L_w^p(v)$ . The illustration of this claim is the purpose of the following example which is a mixture of Examples 3.9 and 3.11.

**Example 4.12.** Let  $\mathcal{R}$  be the  $\delta$ -ring of finite subsets of natural numbers and consider the  $\sigma$ -finite vector measure

$$v : A \in \mathcal{R} \longrightarrow v(A) := \chi_{A \cap \mathbb{O}} + \alpha \cdot \chi_{A \cap \mathbb{E}} \in c_0(\mathbb{N}),$$

where  $\alpha = (\alpha_n)_n$  is the sequence given by  $\alpha_n = n$ , for all  $n = 1, 2, \dots$ , and  $\mathbb{O}$  and  $\mathbb{E}$  are, respectively, the subset of odd and even natural numbers. For every  $1 \leq p < \infty$ , it is not difficult to convince yourself that

$$\begin{aligned} L_w^p(v) &= \left\{ f = (f_n)_n : f \chi_{\mathbb{O}} \in \ell^\infty(\mathbb{N}) \text{ and } f \alpha^{\frac{1}{p}} \chi_{\mathbb{E}} \in \ell^\infty(\mathbb{N}) \right\} \\ &:= \ell^\infty(\mathbb{O}) \oplus \ell^\infty\left(\alpha^{\frac{1}{p}} \mathbb{E}\right), \\ L^p(v) &= \left\{ f = (f_n)_n : f \chi_{\mathbb{O}} \in c_0(\mathbb{N}) \text{ and } f \alpha^{\frac{1}{p}} \chi_{\mathbb{E}} \in c_0(\mathbb{N}) \right\} \\ &:= c_0(\mathbb{O}) \oplus c_0\left(\alpha^{\frac{1}{p}} \mathbb{E}\right). \end{aligned}$$

Analogously we define the spaces  $\ell^\infty(\mathbb{O}) \oplus c_0(\alpha^{\frac{1}{p}} \mathbb{E})$  and  $c_0(\mathbb{O}) \oplus \ell^\infty(\alpha^{\frac{1}{p}} \mathbb{E})$ . Let us consider  $1 \leq p_0 < p_1 < \infty$ ,  $0 < \theta < 1$ , and let  $\frac{1}{p} := \frac{1-\theta}{p_0} + \frac{\theta}{p_1}$ . First we are going to see that  $L^p(v) \subsetneq [L_w^{p_0}(v), L_w^{p_1}(v)]_{[\theta]} \subsetneq L_w^p(v)$ . Clearly the sequence  $f := (1, 0, 1, 0, \dots)$  belongs to  $L_w^{p_0}(v) \cap L_w^{p_1}(v) \subseteq [L_w^{p_0}(v), L_w^{p_1}(v)]_{[\theta]}$ , but  $f \notin L^p(v)$  because  $f \chi_{\mathbb{O}} \notin c_0(\mathbb{N})$ . Now recall that  $L_w^p(v) = [L_w^{p_0}(v), L_w^{p_1}(v)]^{[\theta]}$ , and therefore  $[L_w^{p_0}(v), L_w^{p_1}(v)]_{[\theta]} = \overline{[L_w^{p_0}(v), L_w^{p_1}(v)]^{[\theta]}}^{L_w^p(v)}$ . But, taking into account inclusions (A) stated in Example 3.11 we can easily check that  $L_w^{p_0}(v) \cap L_w^{p_1}(v) \subseteq \ell^\infty(\mathbb{O}) \oplus c_0(\alpha^{\frac{1}{p}} \mathbb{E})$ . Thus

$$\overline{L_w^{p_0}(v) \cap L_w^{p_1}(v)}^{L_w^p(v)} \subseteq \ell^\infty(\mathbb{O}) \oplus c_0\left(\alpha^{\frac{1}{p}} \mathbb{E}\right) \subsetneq \ell^\infty(\mathbb{O}) \oplus \ell^\infty\left(\alpha^{\frac{1}{p}} \mathbb{E}\right) = L_w^p(v).$$

Second, we will see that  $L^p(v) \subsetneq [L^{p_0}(v), L^{p_1}(v)]^{[\theta]} \subsetneq L^p(v)$ . Observe that

$$[L^{p_0}(v), L^{p_1}(v)]^{[\theta]} \subseteq L^{p_0}(v) + L^{p_1}(v) = L^{p_1}(v) = c_0(\mathbb{O}) \oplus c_0\left(\alpha^{\frac{1}{p_1}} \mathbb{E}\right).$$

Clearly the sequence  $f := (1, 0, 1, 0, \dots) \in L_w^p(v)$ , but  $f \notin [L^{p_0}(v), L^{p_1}(v)]^{[\theta]}$ . Finally note that

$$\begin{aligned} L^p(v) &= c_0(\mathbb{O}) \oplus c_0\left(\alpha^{\frac{1}{p}} \mathbb{E}\right) \subsetneq c_0(\mathbb{O}) \oplus \ell^\infty\left(\alpha^{\frac{1}{p}} \mathbb{E}\right) \stackrel{(*)}{=} [L^{p_0}(v), L^{p_1}(v), \theta] \\ &\subseteq [L^{p_0}(v), L^{p_1}(v)]^{[\theta]}. \end{aligned}$$

The above equality  $(*)$  follows by using similar arguments of those used to obtain (9).
